## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION CYN-1

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation CYN-1, which was later reduced in size, was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. This is a small excavation area. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of four (4) samples from the planned excavation footprint. However, changes were made in the excavation plans after sampling was already completed. The original area was reduced, but this resulted in exclusion of some of the original sample collection points from the new footprint. Accordingly, an additional two (2) samples were collected to account for the new excavation footprint of CYN-1. The samples were all analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the CYN-1 planned excavation area are presented in TestAmerica reports ISG0122, issued on 7/15/09 and ISH1607, issued on 9/9/09. With the exception of one sample with elevated Lead concentrations, all regulated metals were well below applicable regulatory thresholds. Chromium was the most significant of the detected metals from a regulatory standpoint, but in five of the six samples collected, it was well below the RCRA and California hazardous waste thresholds. Chromium ranged from 16 ppm to 28 ppm in these samples compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm.

Although Lead was generally observed only at low concentrations, one of the samples collected during the second round of sampling did exhibit Lead at 75 ppm. As this concentration exceeded the CA STLC 10 X threshold (i.e., 50 ppm) requiring leachate testing (WET), the required analysis was performed. The CA WET yielded a 2.7 mg/L concentration for Lead in the sample with the elevated concentration, well below the CA STLC hazardous waste threshold of 5 mg/L. Taking into consideration all of the data from the randomly selected representative samples, the average properties of the soil to be removed during excavation from CYN-1 do not exceed hazardous waste regulatory thresholds.

### **Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley CYN-1:

- Is Not a Listed Waste (generator knowledge)
- Is Not ignitable (generator knowledge)
- Is Not corrosive (generator knowledge)
- Is Not reactive (generator knowledge)
- Is Not toxic (analytical results and generator knowledge)
  - Is Not Extremely or Acutely Hazardous Waste
  - Does Not exceed any RCRA or Title 22 thresholds
  - Is Not subject to the Prop. 65 listing
  - Is Not subject to Title 22 Appendix X list
  - Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in CYN-1 is NON-HAZARDOUS.**

**NOTES**

--" - not applicable

<sup>a</sup> - WET Leachate Testing Trigger = STLC limit \* 10

<sup>b</sup> - TCLP Leachate Testing Trigger = TCLP limit \* 20

B - analyte was detected in the associated method blank

J - Result is estimated

M2 - the matrix spike and/or matrix spike duplicate were below the acceptance limits due to matrix interference

mg/kg - milligrams per kilogram

mg/L - milligrams per liter

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document dated August 17, 2009 that provides the radiological results and statistical analysis of the Outfall 008 waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

This table presents only those waste characterization sample results that actually fall within the boundaries of the final, revised excavation footprints. Other results may have been used in the initial soil characterization, but no longer fall within the final excavation footprints. These results are not included in this table, but have been reassigned as data gap information and are reported elsewhere.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION DRG-1

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

This is a very small area. The review of historical information and existing analytical data relevant to planned excavation DRG-1 was based largely on the Group 1A RFI results, which indicated that Dioxins were of chief interest to the RFI team. However, detected concentrations of Dioxins were exceeding low with respect to hazardous waste characterization. As in the other Happy Valley planned excavation locations, the focus was also placed on regulated metals in the DRG-1 excavation footprint. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of four (4) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the DRG-1 planned excavation area are presented in TestAmerica report ISG0123 issued on 7/15/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 12 ppm to 15 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged from 4.9 ppm to 17 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. All other regulated metals are well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley DRG-1:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in DRG-1 is NON-HAZARDOUS.**

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-1

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-1 was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-1 planned excavation area are presented in TestAmerica report ISG0119, issued on 7/15/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 4.7 ppm to 19 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 3 ppm to 8.7 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. All other regulated metals were well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-1:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-2A

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-2A was based largely on the Group 1A RFI results. Somewhat elevated historical concentrations indicated the need to investigate regulated metals more thoroughly. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. However, changes were made in the excavation plans after sampling was already completed. An additional 7 samples were collected to account for the new excavation footprint. The samples were all analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the various samples collected in the original and revised HVS-2A planned excavation areas are presented in TestAmerica reports ISG0118, issued on 7/15/09; ISG2471, issued on 8/6/09; and ISG2313, issued on 8/11/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 9.7 ppm to 23 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 3.4 ppm to 33 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. Low concentrations of Selenium, a California only regulated metal, were also detected, ranging from

ND to 1.5 ppm. The CA TTLC for Selenium is 100 ppm and the CA STLC 10 X threshold is 10 ppm. All other regulated metals are well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-2A:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in HVS-2A is NON-HAZARDOUS.**

**NOTES**

"--" - not applicable

<sup>a</sup> - WET Leachate Testing Trigger = STLC limit \* 10

<sup>b</sup> - TCLP Leachate Testing Trigger = TCLP limit \* 20

B - analyte was detected in the associated method blank

J - Result is estimated

M2 - the matrix spike and/or matrix spike duplicate were below the acceptance limits due to matrix interference

mg/kg - milligrams per kilogram

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document dated August 17, 2009 that provides the radiological results and statistical analysis of the Outfall 008 waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

This table presents only those waste characterization sample results that actually fall within the boundaries of the final, revised excavation footprints. Other results may have been used in the initial soil characterization, but no longer fall within the final excavation footprints. These results are not included in this table, but have been reassigned as data gap information and are reported elsewhere.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-2B-1

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-2B, which was later divided into two separate areas identified as HVS-2B-1 and HVS-2B-2, was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. However, changes were made in the excavation plans after sampling was already completed. The original area was divided into two separate areas and an additional 2 samples were collected to account for the new excavation footprint of HVS-2B-1. The samples were all analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-2B-1 planned excavation area are presented in TestAmerica report ISG0121, issued on 7/15/09 and ISG2313, issued on 8/11/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 14 ppm to 28 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 3.6 ppm to 34 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. All other regulated metals were well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-2B-1:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in HVS-2B-1 is NON-HAZARDOUS.**

## WASTE CHARACTERIZATION: FURTHER SOIL EXCAVATION AT ISRA HAPPY VALLEY HVS-2B-1 (CONTAINERIZED)

### **Introduction**

This report presents supporting detailed information for characterization of additional soil excavated September 15, 2009 from the bottom of the original ISRA HVS-2B-1 site in Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-2B, which was later divided into two separate areas identified as HVS-2B-1 and HVS-2B-2, was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. However, changes were made in the excavation plans after sampling was already completed. The original area was divided into two separate areas and an additional 2 samples were collected to account for the new excavation footprint of HVS-2B-1. The samples were all analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

The analytical results from the 2 additional samples confirmed the non-hazardous character determined from the original round of sampling. These results are reported in TestAmerica report ISG2313, issued on 8/11/09. Chromium (ranging from 14 ppm to 28 ppm) and Lead (ranging from 3.6 ppm to 34 ppm) were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. All other regulated metals were insignificant with regard to regulatory thresholds.

### **Further Excavation Performed**

Routine confirmation samples were collected from the bottom of HVS-2B-1 following excavation. Analytical results for the HVS-2B-1 confirmation sampling are presented in GEL Laboratories report 236436, issued on 9/10/09. One of the samples exhibited elevated Copper, which is regulated by California, but not under RCRA, at 1,550 ppm. A slightly elevated concentration of Lead was also detected at 54.3 ppm. These results suggested a small pocket of Copper and Lead impacted soil in this area.

As a result of the elevated concentrations, California Waste Extraction Tests (WET) were ordered for the samples to determine the status of the impacted soil relative to California Soluble Threshold Limit Concentration (STLC) thresholds. Additionally, another sample was collected from the area and submitted for analysis of Semi-Volatile Compound (SVOC) concentrations.

To assure proper management of the soil while the WET laboratory analyses were being performed regardless of testing outcomes, the soil was excavated to bedrock and contained in approved hazardous waste containers.

### **Results**

Analytical results for the HVS-2B-1 California WET analyses are presented in GEL Laboratories report 237085, issued on 9/18/09 and revised 8/11/09. The WET results for Lead ranged from 1.85 mg/L to 2.11 mg/L, well below the STLC limit of 5 mg/L for Lead. The WET results for Copper ranged from 13.2 mg/L to 13.8 mg/L, again well below the STLC limit of 25 mg/L.

The SVOC results indicated only trace concentrations of two analytes, Pyrene at 0.0108 ppm and Bis(2-Ethylhexyl)phthalate at 0.0837 ppm.

### **Determination**

According to analytical results and generator knowledge, the containerized soil from further excavation at Happy Valley HVS-2B-1:

- Is Not a Listed Waste (generator knowledge)
- Is Not ignitable (generator knowledge)
- Is Not corrosive (generator knowledge)
- Is Not reactive (generator knowledge)
- Is Not toxic (analytical results and generator knowledge)
  - Is Not Extremely or Acutely Hazardous Waste
  - Does Not exceed any RCRA or Title 22 thresholds
  - Is Not subject to the Prop. 65 listing
  - Is Not subject to Title 22 Appendix X list
  - Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The containerized soil from HVS-2B-1 is NON-HAZARDOUS.**

Boeing has prepared a document that provides the radiological results and statistical analysis of the Outfall 008 waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-2B-2

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-2B, which was later divided into two separate areas identified as HVS-2B-1 and HVS-2B-2, was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. However, changes were made in the excavation plans after sampling was already completed. The original area was divided into two separate areas and an additional four (4) samples were collected to account for the new excavation footprint of HVS-2B-2. The samples were all analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-2B-2 planned excavation area are presented in TestAmerica report ISG0121, issued on 7/15/09 and ISG2313, issued on 8/11/09. With the exception of one (1) sample that exhibited an elevated Chromium concentration, all regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint. Chromium ranged from 3.6 ppm to 57 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. An STLC WET test was performed on the sample with elevated Chromium. The STLC result was 0.095 mg/L compared to the STLC hazardous waste threshold of 5 mg/L. With such

a dramatic reduction from the total Chromium concentration when the STLC WET leachate analysis was performed, further investigation of Chromium was determined to be unnecessary.

Lead ranged 3.6 ppm to 20 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. A slightly elevated concentration of Mercury was also detected in one (1) sample at 0.37 ppm compared to the TCLP 20 X threshold of 4 ppm, the CA TTLC threshold of 20 ppm, and the CA STLC 10 X threshold of 2 ppm. All other regulated metals were well below regulatory thresholds.

### **Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-2B-2:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in HVS-2B-2 is NON-HAZARDOUS.**

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-2C

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-2C was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-2C planned excavation area are presented in TestAmerica report ISG0117, issued on 7/15/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 12 ppm to 27 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 4.2 ppm to 24 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. All other regulated metals were well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-2C:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-3

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation HVS-3 was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-3 planned excavation area are presented in TestAmerica report ISG0120, issued on 7/15/09. All regulated metals were well below applicable regulatory thresholds. Cadmium, Chromium, and Lead were most significant from a regulatory standpoint, but all three were well below their respective RCRA and California hazardous waste thresholds. Cadmium ranged from ND to 1.8 ppm compared to the TCLP 20 X threshold of 20 ppm, the CA TTLC threshold of 100 ppm, and the CA STLC 10 X threshold of 10 ppm. Chromium ranged from 12 ppm to 16 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 8.9 ppm to 24 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. Copper, which is a California only regulated metal, was also detected at slightly elevated concentrations ranging between 6.8 ppm and 180 ppm compared to the CA TTLC threshold of 2,500 ppm and the CA STLC 10 X threshold of 250 ppm. All other regulated metals are well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-3:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in HVS-3 is NON-HAZARDOUS.**

M2 - the matrix spike and/or matrix spike duplicate were below the acceptance limits due to matrix interference

mg/kg - milligrams per kilogram

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document dated August 17, 2009 that provides the radiological results and statistical analysis of the Outfall 008 waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA HAPPY VALLEY PLANNED EXCAVATION HVS-4

### **Introduction**

This report presents supporting detailed information for the July 16, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations at Happy Valley.

### **Background**

In-situ characterization of soil destined to be excavated from Happy Valley in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the Happy Valley (HV). The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

This is a very small area. The review of historical information and existing analytical data relevant to planned excavation HVS-4 was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of four (4) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the HVS-4 planned excavation area are presented in TestAmerica report ISG2313 issued on 8/11/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 13 ppm to 16 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 9.4 ppm to 12 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. All other regulated metals are well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of Happy Valley HVS-4:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in HVS-4 is NON-HAZARDOUS.**

WASTE CHARACTERIZATION: STOCKPILED SOIL FROM HVS-2D, HVS-3, AND  
EXCAVATION OF THE NATURAL GAS PIPELINE

**Introduction**

This report describes the waste characterization process and results pertaining to soil excavated during removal of what is believed to be an out-of-service natural gas pipeline and from designated ISRA locations in the SSFL Happy Valley.

**Background**

In-situ soil waste characterization was carried out at locations identified for excavation in the Happy Valley (Outfall 8) ISRA Workplan. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation, including reviews of historical area usage and existing analytical data from past soil sampling, random sampling of each planned excavation footprint, and additional sampling as required for statistical integrity and ISRA project objective attainment confirmation. The results of all characterizations performed in Happy Valley prior to the present activity demonstrated that the excavated soils could be shipped off-site for disposal as non-hazardous waste. These determinations were based on 61 soil samples collected specifically for waste characterization and dozens of other samples analyzed during past soil survey and confirmation activities.

The present activity involves excavation and stockpiling of soil excavated from 3 non-contiguous ISRA locations in Happy Valley: HVS-2D, HVS-3, and the trench resulting from removal of an out-of-service natural gas pipeline.

**HVS-2D**

HVS-2D was located immediately adjacent to the original planned HVS-2A excavation footprint, which was subjected to in-situ sampling. Furthermore, HVS-2D was in close proximity to the revised HVS-2A excavation footprint (approximately 50 feet), where additional in-situ sampling was conducted to account for the change in planned excavation boundaries. For these reasons, waste characterization data from HVS-2A were also applicable to HVS-2D, and no additional in-situ sampling was conducted at this location.

Analytical results for the 15 samples collected in the original and revised HVS-2A planned excavation areas are presented in TestAmerica reports ISG0118, issued on 7/15/09; ISG2471, issued on 8/6/09; and ISG2313, issued on 8/11/09. All regulated metals were well below applicable regulatory thresholds. Chromium and Lead were most significant from a regulatory standpoint, but both were well below their respective RCRA and California hazardous waste thresholds. Chromium ranged from 9.7 ppm to 23 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 3.4 ppm to 33 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. Low concentrations of Selenium, a California only regulated metal, were also detected, ranging from ND to 1.5 ppm. The CA TTLC for Selenium is 100 ppm and the CA STLC 10 X threshold is 10 ppm. All other regulated metals are well below regulatory thresholds.

The soil in the area of HVS-2A was determined to be non-hazardous, and, consequently, so was the soil in HVS-2D. This determination was confirmed by a follow-up sample collected from

the bottom of the HVS-2D excavation. Lead in this sample was detected at a concentration of 4.63 ppm, which is far below applicable regulatory thresholds.

### **HVS-3**

The review of historical information and existing analytical data relevant to planned excavation HVS-3 was based largely on the Group 1A RFI results. No major concerns with respect to hazardous waste characterization were revealed by the review, but it did suggest that any further analysis should focus on regulated metals. To obtain additional data relating to regulated metals, a random sampling plan was developed for collection of eight (8) samples from the planned excavation footprint. The samples were to be analyzed for CAM 17 metals. All samples were collected, contained, and handled according to field practice requirements in SW-846.

Analytical results for the HVS-3 planned excavation area are presented in TestAmerica report ISG0120, issued on 7/15/09. All regulated metals were well below applicable regulatory thresholds. Cadmium, Chromium, and Lead were most significant from a regulatory standpoint, but all three were well below their respective RCRA and California hazardous waste thresholds. Cadmium ranged from ND to 1.8 ppm compared to the TCLP 20 X threshold of 20 ppm, the CA TTLC threshold of 100 ppm, and the CA STLC 10 X threshold of 10 ppm. Chromium ranged from 12 ppm to 16 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 2,500 ppm, and the CA STLC 10 X threshold of 50 ppm. Similarly, Lead ranged 8.9 ppm to 24 ppm compared to the TCLP 20 X threshold of 100 ppm, the CA TTLC threshold of 1,000 ppm, and the CA STLC 10 X threshold of 50 ppm. Copper, which is a California only regulated metal, was also detected at slightly elevated concentrations ranging between 6.8 ppm and 180 ppm compared to the CA TTLC threshold of 2,500 ppm and the CA STLC 10 X threshold of 250 ppm. All other regulated metals are well below regulatory thresholds supporting the determination that the soil in HVS-3 is non-hazardous.

### **Pipeline Trench**

Like HVS-2D, the pipeline identified for removal was located in the general area of HVS-2A. The waste characterization results from HVS-2A are applicable to soil excavated during trenching for pipeline removal, and the trench soil was determined to be non-hazardous. Following removal of the pipeline, 3 confirmation samples were collected from the bottom of the trench and analyzed for asbestos and Polychlorinated Biphenyls (PCB). No asbestos was observed. However, very low concentrations of PCBs were detected in the samples at a maximum of 0.1 ppm. The trench was over-excavated in accordance with ISRA project objectives, but concentrations at these levels are not significant with respect to hazardous waste regulations.

### **Excavated Soil Stockpile**

Upon excavation, soil from HVS-2D, HVS-3, and the pipeline removal trench were transported to an asphalt surfaced staging area and stockpiled. At the completion of excavation activities, the stockpile contained a total of approximately 50 cubic yards of soil.

A single sample was randomly collected from the stockpile itself. Analytical results are presented in TestAmerica report ISJ2591, issued on 11/16/09. No PCBs were detected in the sample. All detected regulated metals were at very low concentrations. Chromium and Lead were the most significant detections with respect to hazardous waste regulations. However, Chromium was detected at 15 ppm, compared with the RCRA 20X threshold of 100 ppm and

the California STLC WET threshold of 50 ppm. All other regulated metals exhibited an even greater divergence from applicable regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the stockpile containing material from Happy Valley HVS-2D, HVS-3, and the pipeline excavation trench:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not characteristically toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

Does Not exceed any RCRA or Title 22 thresholds

Is Not subject to the Prop. 65 listing if it is applied to 22 CCR 66261.24(a)(7)

Is Not subject to the Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bioaccumulative properties, or persistence in the environment.

**The soil in the stockpile containing soil from Happy Valley HVS-2D, HVS-3, and the pipeline excavation trench is NON-HAZARDOUS.**

## INTERIM SOURCE REMOVAL ACTION (ISRA) - OUTFALL 008

### HVS-2D, HVS-3, AND PIPELINE NEAR HVS-2A SOIL WASTE CHARACTERIZATION RESULTS THE BOEING COMPANY SANTA SUSANA FIELD LABORATORY

#### NOTES

Sample was randomly collected from a stockpile containing soil from HVS-2D, HVS-3, and from below the pipeline near HVS-2A

"--" - not applicable

<sup>a</sup> - No sample depth because sample was collected from a stockpile

<sup>b</sup> - WET Leachate Testing Trigger = STLC limit \* 10

<sup>c</sup> - TCLP Leachate Testing Trigger = TCLP limit \* 20

J - Result is estimated

mg/kg - milligrams per kilogram

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document that provides the radiological results and statistical analysis of the Outfall 008 waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

**Happy Valley Interim Source Removal Action (ISRA).  
Soil Sampling for Radionuclides.  
Results and Statistical Analysis.  
Waste Certification.**

This data package provides the laboratory results and statistical analysis of pre-excavation samples taken from the Happy Valley Interim Source Removal Action (ISRA) area. This analysis and data interpretation complies with procedures approved by the California Department of Public Health<sup>1</sup>.

Forty eight (48) samples taken for waste disposal characterization were analyzed for strontium-90, tritium and gamma emitting radionuclides by gamma spectroscopy, using an off-site laboratory. Minimum detectable activity (MDA) for cesium-137 and strontium-90 averaged ~0.04 pCi/g and ~0.04 pCi/g respectively. Minimum detectable activity for tritium averaged ~1.0 pCi/g. The gamma spectroscopy library also included the following contaminants-of-concern: Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241. Laboratory data packages are available on request.

Statistical evaluation of sample analytical results to determine whether or not the sampled waste contains Cs-137 or Sr-90 activity elevated above local background was conducted using the Wilcoxon Rank Sum Test using protocols described in NUREG-1505<sup>2</sup> and DTSC guidance<sup>3</sup> (See Appendix 1). Appendix 2 shows the complete analytical results for all radionuclides. Complete laboratory data packages are available on request.

Local background data for cesium-137 and strontium-90 was taken from Table 20 of the 1995 McLaren/Hart report<sup>4</sup>. Background for tritium in soil is not well established, and is not reported in the 1995 McLaren/Hart report, therefore tritium background in soil is conservatively assumed to be zero. Tritium data is therefore compared to the MDA of the analysis and the EPA preliminary remediation goal (PRG)<sup>5</sup> for residential  $10^{-6}$  risk.

## Conclusions

**Cesium-137** - Based on the results of the statistical analysis of Appendix 1, soil to be excavated from the Happy Valley ISRA area does not exceed the local background for Cs-137. The incremental dose from Cs-137 above background is therefore zero mrem/y. The highest Cs-137 result is 0.113 pCi/g which is less than the highest background result. The highest non-background subtracted Cs-137 result is less than an effective dose of 0.08 mrem/y<sup>6</sup>.

**Strontium-90** - Based on the results of the statistical analysis of Appendix 1, soil to be excavated from the Happy Valley ISRA area does not exceed the local background for Sr-90. The incremental dose from Sr-90 above background is therefore zero mrem/y. The highest Sr-90 result is 0.042 pCi/g which is less than the highest background result. The highest non-background subtracted Sr-90 result is less than an effective dose of 0.013 mrem/y<sup>6</sup>.

**Tritium** - All tritium results are non-detect, the average tritium result is -0.22 pCi/g and the highest non-detect tritium result is 0.39 pCi/g. The highest non-detect, non-background subtracted tritium result is less than an effective dose of 0.0055 mrem/y<sup>6</sup>.

This waste is certified to be “radiologically” acceptable for shipment to, and disposal at, any Class 1, 2 or 3 disposal facility. There are no radiological controls or restrictions imposed on future disposition or use of this soil.

This waste meets the requirements of disposal facility permits<sup>7,8</sup> and complies with the California Health & Safety Code<sup>9</sup>.

The Governor’s Executive Order D-62-02 prohibits the “*disposal of decommissioned materials to Class III landfills or unclassified management units.*” The soil from the Happy Valley ISRA area is

---

<sup>6</sup> EPA dose compliance concentrations for radionuclides - <http://epa-dccs.ornl.gov/>. Soil concentrations that meet the 10<sup>-6</sup> residential risk PRG are < 0.1 mrem/y. The Cs-137 residential PRG of 0.0597 pCi/g is equivalent to 0.042 mrem/y. The Sr-90 residential PRG of 0.231 pCi/g is equivalent to 0.071 mrem/y. The tritium residential PRG of 2.28 pCi/g is equivalent to 0.032 mrem/y.

<sup>7</sup> This waste is exempt from regulation and licensing or is expressly authorized for disposal under the Radiation Control Law (Division 104, Part 9, Chapter 8 of the California Health & Safety Code).

<sup>8</sup> This waste is not prohibited from disposal by any government agency with jurisdictional authority over this waste.

<sup>9</sup> Division 104, Part 9, Chapter 5, Article 1, Section 114715, “No person shall bury, throw away, or in any manner dispose of radioactive wastes within the state except in a manner and at locations as will result in no significant radioactive contamination of the environment.” For the purposes of this requirement, “significant” is defined in Section 114710 as amounts of radioactive materials that are likely to expose persons to ionizing radiation greater than the guide levels published by the Federal Radiation Council (FRC). The FRC no longer exists, but the applicable guide level last published by the FRC was 500 mrem per year to a member of the public. Because the regulatory dose limit to members of the public has since been lowered to 100 mrem per year, CDPH/RHB conservatively utilizes the lower dose for purposes of defining “significant” radioactive contamination in this Article of the California Health and Safety Code.  
<http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=114001-115000&file=114705-114780>

not decommissioned material, and does not originate from the proximity of any radiological facility. The sampling in this certification has therefore been conducted as a best management practice that also complies with the requirements of D-62-02. Verification sampling and/or approval by the California Department of Public Health (CDPH) Radiologic Health Branch (RHB) are not required for the off-site disposal of decommissioned material or of the subject material<sup>10</sup>.

Phil Rutherford  
Manager, Health, Safety & Radiation Services

---

<sup>10</sup> The California Department of Public Health (CDPH) Radiologic Health Branch (RHB) has stated in a November 9, 2007 email to Phil Rutherford (Boeing) ... *"The Governor's Executive Order D-62-02, does not specifically require the Department of Health Services (now the Department of Public Health) to perform verification sampling of decommissioned material or to provide approval for disposal of specific decommissioned material shipped offsite (e.g., to Class I or II landfills). The California DPH has not imposed a requirement that Boeing or the Department of Energy (DOE) seek DPH verification sampling or approval of all decommissioned material destined for Class I or II landfills in compliance with the Governor's Executive Order."*

**Appendix 1**

**Wilcoxon Rank Sum Statistical Test for Cesium-137 and Strontium-90**

**Wilcoxon Rank Sum Test -- (Cesium-137)****General Information:**

The WRS tests whether or not measurements of samples from a survey area (S) tend to be consistently larger than those from a background reference area (R) by more than the DCGL.

The null hypothesis,  $H_0$ , is: Survey sample concentrations exceed those in the background

The alternative hypothesis,  $H_a$ , is: Survey sample concentrations do not exceed those in the background

**Instruction on how to use this template:**

- 1) Enter analysis results in pCi/gram
- 2) Enter number of samples for background and survey data sets, m and n.
- 3) The WRS test is calculated using the method prescribed in NUREG-1505, Nuclear Regulatory Commission, "A Non-parametric Statistical Methodology for the Design and Analysis of Final Status Decommissioning Surveys." January 1998.

DCGL (pCi/g)	0.00
Type I Error Rate, Alpha:	0.05
Type II Error Rate, Beta:	0.05
Number of Background Samples, m:	51
Number of Survey Samples, n:	48
Z-value for Alpha	1.645
Critical Value	2785
Sum of Reference Ranks	3286

If the sum of the reference ranks is larger than the critical value, there is enough evidence to reject the null hypothesis and accept the alternative hypothesis. Otherwise the null hypothesis is accepted.

**Test Result:**

**Survey sample concentrations do not exceed those in the background by more than the DCGL**

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA AREA II PLANNED EXCAVATION A2LF-1

### **Introduction**

This report presents supporting detailed information for the September 3, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations in SSFL Area II.

### **Background**

In-situ characterization of soil destined to be excavated from designated locations in SSFL Area II in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the applicable SSFL Area II locations. The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation A2LF-1 was based largely on the Group 2 RFI results. Evaluation of these data and other sources of relevant information suggested that Petroleum Hydrocarbons (TPH), Volatile Organic Compounds (VOC), Regulated metals, Polychlorinated Biphenyls (PCB), and Semi-Volatile Organic Compounds (SVOC) should be addressed in the A2LF-1 excavation footprint. A random sampling plan was developed for collection of Four (4) samples from the planned excavation footprint, taking into account the relatively small area to be excavated. The samples were analyzed for TPH, VOC, CAM 17 metals, PCBs, and SVOCs. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the A2LF-1 planned excavation area are presented in TestAmerica report ISI0508 issued on 9/25/09. TPH in the C10 - C40 range was detected in all of the samples. Concentrations were low, with a maximum of 54 mg/kg. No Petroleum Hydrocarbons in the C6 - C12 range (gasoline) were detected. A trace concentration of Acetone was detected at 0.015 mg/kg, possibly a lab artifact. No other VOCs were detected. No SVOCs were detected, and no PCBs were detected.

Low concentrations of some regulated metals were detected. Chromium was detected at concentrations ranging from 17 mg/kg to 23 mg/kg. Lead was detected at concentrations

ranging from 2.6 mg/kg to 13 mg/kg. These and all other detected regulated metals were well below regulatory thresholds.

**Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of SSFL Area II A2LF-1:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is Not toxic (analytical results and generator knowledge)

    Is Not Extremely or Acutely Hazardous Waste

    Does not exceed any RCRA or Title 22 thresholds

    Is Not subject to the Prop. 65 listing

    Is Not subject to Title 22 Appendix X list

    Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in A2LF-1 is NON-HAZARDOUS.**

**INTERIM SOURCE REMOVAL ACTION (ISRA) - OUTFALL 009**

**A2LF-1 WASTE CHARACTERIZATION RESULTS  
THE BOEING COMPANY  
SANTA SUSANA FIELD LABORATORY**

**Notes:**

"--" - not analyzed / not applicable

<sup>1</sup> - WET Leachate Testing Trigger = STLC limit \* 10

<sup>2</sup> - TCLP Leachate Testing Trigger = TCLP limit \* 20

I - Internal Standard recovery was outside of method limits. Matrix interference was confirmed.

J - Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.

L - Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the acceptance limits. Analyte not detected, data not impacted.

M1 - The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

M2 - The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

M7 - The MS and/or MSD were above the acceptance limits. See Blank Spike (LCS).

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document dated September 21, 2009 that provides the radiological results and statistical analysis of the Outfall 009 A2LF waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

R-3 - The RPD exceeded the acceptance limit due to sample matrix effects

RL1 - Reporting limit raised due to sample matrix effects.

## WASTE CHARACTERIZATION: IN-SITU SOIL LOCATED AT ISRA AREA II PLANNED EXCAVATION A2LF-3

### **Introduction**

This report presents supporting detailed information for the September 3, 2009 in-situ characterization of prospective soil wastes from planned ISRA excavations in SSFL Area II.

### **Background**

In-situ characterization of soil destined to be excavated from designated locations in SSFL Area II in accordance with the ISRA Workplan was performed. A step-by-step approach was followed to accomplish characterization of the soil prior to excavation. The first step was to review available information regarding historical area usage and existing analytical data from past soil sampling in the applicable SSFL Area II locations. The objective was to identify all substances that could have an impact on the determination of whether soil in each planned excavation footprint was hazardous or not.

The next step was to develop a random sampling plan for each of the planned excavation footprints to determine whether any of the identified substances are present at concentrations that require further investigation. An evaluation of the results of the initial random sampling was performed to determine whether the data was adequate for waste characterization based on the exhibited variance of any detected analytes and the relative difference between detected concentrations and regulatory thresholds. The soil was characterized non-hazardous when analyte concentrations among the samples exhibited a reasonably small variance and there was satisfactory margin between the mean of the samples and applicable regulatory thresholds. Otherwise, additional samples were collected and subjected to analysis or the soil was characterized as hazardous.

The review of historical information and existing analytical data relevant to planned excavation A2LF-3 was based largely on the Group 2 RFI results. Evaluation of these data and other sources of relevant information suggested that Petroleum Hydrocarbons (TPH), Volatile Organic Compounds (VOC), Regulated metals, Polychlorinated Biphenyls (PCB), and Semi-Volatile Organic Compounds (SVOC) should be addressed in the A2LF-3 excavation footprint. A random sampling plan was developed for collection of Four (4) samples from the planned excavation footprint, taking into account the relatively small area to be excavated. The samples were analyzed for TPH, VOC, CAM 17 metals, PCBs, and SVOCs. All samples were collected, contained, and handled according to field practice requirements in SW-846.

### **Results**

Analytical results for the A2LF-3 planned excavation area are presented in TestAmerica report ISI0508 issued on 9/25/09. TPH in the C10 - C40 range was detected in all of the samples. Concentrations were low, with a maximum of 150 mg/kg. No Petroleum Hydrocarbons in the C6 - C12 range (gasoline) were detected. A trace concentration of Acetone was detected at 0.009 mg/kg, as well as Toluene at a concentration of 0.0008 mg/kg. No other VOCs were detected. SVOCs were detected, but all were below an individual and collective concentration of 1 mg/kg in any given sample. No PCBs were detected.

Regulated metals were detected, and in one case exceeded the California STLC 10 X rule requiring the performance of the WET leachate test. Chromium was detected at concentrations

ranging from 17 mg/kg to 27 mg/kg. Lead was detected at concentrations ranging from 27 mg/kg to 74 mg/kg. The required California WET for Lead was conducted on the sample that exceeded the total Lead 50 ppm threshold and resulted in a leachate concentration of 3.7 mg/L. Although this is below the California STLC hazardous waste threshold, other factors were also of importance in characterizing this soil. The Lead detections were not tightly grouped. Consequently, a large variance, and the proximity of the mean concentration to the regulatory threshold, indicated that additional sampling was needed before analytical results could be considered representative of the average soil characteristics.

All other detected regulated metals were well below regulatory thresholds.

### **Determination**

According to analytical results and generator knowledge, the soil in the planned excavation footprint of SSFL Area II A2LF-3:

Is Not a Listed Waste (generator knowledge)

Is Not ignitable (generator knowledge)

Is Not corrosive (generator knowledge)

Is Not reactive (generator knowledge)

Is potentially toxic (analytical results and generator knowledge)

Is Not Extremely or Acutely Hazardous Waste

**May exceed the Title 22 threshold for Lead**

Is Not subject to the Prop. 65 listing

Is Not subject to Title 22 Appendix X list

Is Not known by experience or testing to pose a hazard to human health or environment because of its carcinogenicity, acute toxicity, chronic toxicity, bio-accumulative properties, or persistence in the environment.

**The soil in A2LF-3 will be managed as HAZARDOUS in lieu of additional sampling.**

**INTERIM SOURCE REMOVAL ACTION (ISRA) - OUTFALL 009**

**A2LF-3 WASTE CHARACTERIZATION RESULTS  
THE BOEING COMPANY  
SANTA SUSANA FIELD LABORATORY**

**Notes:**

"--" - not analyzed / not applicable

<sup>1</sup> - WET Leachate Testing Trigger = STLC limit \* 10

<sup>2</sup> - TCLP Leachate Testing Trigger = TCLP limit \* 20

I - Internal Standard recovery was outside of method limits. Matrix interference was confirmed.

J - Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.

L - Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the acceptance limits. Analyte not detected, data not impacted.

M1 - The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

M2 - The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).

M7 - The MS and/or MSD were above the acceptance limits. See Blank Spike (LCS).

µg/kg - micrograms per kilogram

mg/kg - milligrams per kilogram

mg/L - milligrams per liter

R - Radiological analysis includes gamma spectroscopy (Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241), strontium-90, and tritium. Boeing has prepared a document dated September 21, 2009 that provides the radiological results and statistical analysis of the Outfall 009 A2LF waste characterization samples. Based on the results, the document certifies the soil represented by these waste characterization samples to be "radiologically" acceptable for shipment to Class 1, 2, and/or 3 disposal facilities. The analysis and data interpretation complies with procedures approved by the California Department of Public Health.

R-3 - The RPD exceeded the acceptance limit due to sample matrix effects

RL1 - Reporting limit raised due to sample matrix effects.

**Area II Landfill Interim Source Removal Action (ISRA).  
Soil Sampling for Radionuclides.  
Results and Statistical Analysis.  
Waste Certification.**

This data package provides the laboratory results and statistical analysis of pre-excavation samples taken from the Area II Landfill Interim Source Removal Action (ISRA) area. This analysis and data interpretation complies with procedures approved by the California Department of Public Health<sup>1</sup>.

Eight (8) samples taken for waste disposal characterization were analyzed for strontium-90, tritium and gamma emitting radionuclides by gamma spectroscopy, using an off-site laboratory. Minimum detectable activity (MDA) for cesium-137 and strontium-90 averaged ~0.044 pCi/g and ~0.040 pCi/g respectively. Minimum detectable activity for tritium averaged 0.82 pCi/g. The gamma spectroscopy library also included the following contaminants-of-concern: Na-22, K-40, Mn-54, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Th-228, Th-232, U-235, U-238 and Am-241. Laboratory data packages are available on request.

Statistical evaluation of sample analytical results to determine whether or not the sampled waste contains Cs-137 or Sr-90 activity elevated above local background was conducted using the Wilcoxon Rank Sum Test using protocols described in NUREG-1505<sup>2</sup> and DTSC guidance<sup>3</sup> (See Appendix 1). Appendix 2 shows the complete analytical results for all radionuclides. Complete laboratory data packages are available on request.

Local background data for cesium-137 and strontium-90 was taken from Table 20 of the 1995 McLaren/Hart report<sup>4</sup>. Background for tritium in soil is not well established, and is not reported in the 1995 McLaren/Hart report, therefore tritium background in soil is conservatively assumed to be zero. Tritium data is therefore compared to the MDA of the analysis and the EPA preliminary remediation goal (PRG)<sup>5</sup> for residential 10<sup>-6</sup> risk.

<sup>5</sup> EPA preliminary remediation goals for radionuclides - <http://epa-prgs.ornl.gov/radionuclides/>.

## Conclusions

**Cesium-137** - Based on the results of the statistical analysis of Appendix 1, soil to be excavated from the Area II Landfill ISRA area does not exceed the local background for Cs-137. The incremental dose from Cs-137 above background is therefore zero mrem/y. The highest Cs-137 result is 0.178 pCi/g which is less than the highest background result. The highest non-background subtracted Cs-137 result is equivalent to an effective dose of 0.125 mrem/y<sup>6</sup>.

**Strontium-90** - Based on the results of the statistical analysis of Appendix 1, soil to be excavated from the Area II Landfill ISRA area does not exceed the local background for Sr-90. The incremental dose from Sr-90 above background is therefore zero mrem/y. The highest Sr-90 result is 0.029 pCi/g which is less than the highest background result. The highest non-background subtracted Sr-90 result is equivalent to an effective dose of 0.0089 mrem/y<sup>6</sup>.

**Tritium** - All tritium results are non-detect, the average tritium result is -0.31 pCi/g and the highest non-detect tritium result is -0.136 pCi/g. The highest non-detect, non-background subtracted tritium result is equivalent to an effective dose of 0.0 mrem/y<sup>6</sup>.

This waste is certified to be “radiologically” acceptable for shipment to, and disposal at, any Class 1, 2 or 3 disposal facility. There are no radiological controls or restrictions imposed on future disposition or use of this soil.

This waste meets the requirements of disposal facility permits<sup>7,8</sup> and complies with the California Health & Safety Code<sup>9</sup>.

The Governor’s Executive Order D-62-02 prohibits the “*disposal of decommissioned materials to Class III landfills or unclassified management units.*” The soil from the Area II Landfill ISRA area

---

<sup>6</sup> EPA dose compliance concentrations for radionuclides - <http://epa-dccs.ornl.gov/>. Soil concentrations that meet the 10<sup>-6</sup> residential risk PRG are < 0.1 mrem/y. The Cs-137 residential PRG of 0.0597 pCi/g is equivalent to 0.042 mrem/y. The Sr-90 residential PRG of 0.231 pCi/g is equivalent to 0.071 mrem/y. The tritium residential PRG of 2.28 pCi/g is equivalent to 0.032 mrem/y.

<sup>7</sup> This waste is exempt from regulation and licensing or is expressly authorized for disposal under the Radiation Control Law (Division 104, Part 9, Chapter 5 of the California Health & Safety Code).

<sup>8</sup> This waste is not prohibited from disposal by any government agency with jurisdictional authority over this waste.

<sup>9</sup> Division 104, Part 9, Chapter 5, Article 1, Section 114715, “No person shall bury, throw away, or in any manner dispose of radioactive wastes within the state except in a manner and at locations as will result in no significant radioactive contamination of the environment.” For the purposes of this requirement, “significant” is defined in Section 114710 as amounts of radioactive materials that are likely to expose persons to ionizing radiation greater than the guide levels published by the Federal Radiation Council (FRC). The FRC no longer exists, but the applicable guide level last published by the FRC was 500 mrem per year to a member of the public. Because the regulatory dose limit to members of the public has since been lowered to 100 mrem per year, CDPH/RHB conservatively utilizes the lower dose for purposes of defining “significant” radioactive contamination in this Article of the California Health and Safety Code.  
<http://www.leginfo.ca.gov/cgi-bin/displaycode?section=hsc&group=114001-115000&file=114705-114780>

is not decommissioned material, and does not originate from the proximity of any radiological facility. The sampling in this certification has therefore been conducted as a best management practice that also complies with the requirements of D-62-02. Verification sampling and/or approval by the California Department of Public Health (CDPH) Radiologic Health Branch (RHB) are not required for the off-site disposal of decommissioned material or of the subject material<sup>10</sup>.

Phil Rutherford  
Manager, Health, Safety & Radiation Services

---

<sup>10</sup> The California Department of Public Health (CDPH) Radiologic Health Branch (RHB) has stated in a November 9, 2007 email to Phil Rutherford (Boeing) ... *"The Governor's Executive Order D-62-02, does not specifically require the Department of Health Services (now the Department of Public Health) to perform verification sampling of decommissioned material or to provide approval for disposal of specific decommissioned material shipped offsite (e.g., to Class I or II landfills). The California DPH has not imposed a requirement that Boeing or the Department of Energy (DOE) seek DPH verification sampling or approval of all decommissioned material destined for Class I or II landfills in compliance with the Governor's Executive Order."*

**Appendix 1**

**Wilcoxon Rank Sum Statistical Test for Cesium-137 and Strontium-90**

**Wilcoxon Rank Sum Test -- (Cesium-137)****General Information:**

The WRS tests whether or not measurements of samples from a survey area (S) tend to be consistently larger than those from a background reference area (R) by more than the DCGL.

The null hypothesis,  $H_0$ , is: Survey sample concentrations exceed those in the background

The alternative hypothesis,  $H_a$ , is: Survey sample concentrations do not exceed those in the background

**Instruction on how to use this template:**

- 1) Enter analysis results in pCi/gram
- 2) Enter number of samples for background and survey data sets, m and n.
- 3) The WRS test is calculated using the method prescribed in NUREG-1505, Nuclear Regulatory Commission, "A Non-parametric Statistical Methodology for the Design and Analysis of Final Status Decommissioning Surveys." January 1998.

DCGL (pCi/g)	0.12
Type I Error Rate, Alpha:	0.05
Type II Error Rate, Beta:	0.05
Number of Background Samples, m:	51
Number of Survey Samples, n:	8
Z-value for Alpha	1.645
Critical Value	1604
Sum of Reference Ranks	1714

If the sum of the reference ranks is larger than the critical value, there is enough evidence to reject the null hypothesis and accept the alternative hypothesis. Otherwise the null hypothesis is accepted.

**Test Result:**

**Survey sample concentrations do not exceed those in the background by more than the DCGL**

**Wilcoxon Rank Sum Test -- (Strontium-90)****General Information:**

The WRS tests whether or not measurements of samples from a survey area (S) tend to be consistently larger than those from a background reference area (R) by more than the DCGL.

The null hypothesis,  $H_0$ , is: Survey sample concentrations exceed those in the background

The alternative hypothesis,  $H_a$ , is: Survey sample concentrations do not exceed those in the background

**Instruction on how to use this template:**

- 1) Enter analysis results in pCi/gram
- 2) Enter number of samples for background and survey data sets, m and n.
- 3) The WRS test is calculated using the method prescribed in NUREG-1505, Nuclear Regulatory Commission, "A Non-parametric Statistical Methodology for the Design and Analysis of Final Status Decommissioning Surveys." January 1998.

DCGL (pCi/g)	0.06
Type I Error Rate, Alpha:	0.05
Type II Error Rate, Beta:	0.05
Number of Background Samples, m:	51
Number of Survey Samples, n:	8
Z-value for Alpha	1.645
Critical Value	1604
Sum of Reference Ranks	1734

If the sum of the reference ranks is larger than the critical value, there is enough evidence to reject the null hypothesis and accept the alternative hypothesis. Otherwise the null hypothesis is accepted.

Test Result:

**Survey sample concentrations do not exceed those in the background by more than the DCGL**
