CERTIFIED MAIL

January 17, 2007  
In reply refer to SHEA-104688

Ms. Cassandra Owens  
Regional Water Quality Control Board  
Los Angeles Region  
320 W. 4<sup>th</sup> Street, Suite 200  
Los Angeles, California 90013

Subject: Submittal of Technical Report  
Pursuant to Section 13267 of the California Water Code  
The Boeing Company, Santa Susana Field Laboratory  
Ventura County, California (NPDES Permit No. CA0001309)

Dear Ms. Owens:

The Boeing Company (Boeing) is submitting this Technical Report to the California Regional Water Quality Control Board, Los Angeles Region (RWQCB) to satisfy the requirements in the May 20, 2004 RWQCB letter (Attachment 1). The May 20, 2004 letter, pursuant to Section 13267 of the California Water Code, requested Boeing to perform specific sampling and analyses of storm water collected at the Santa Susana Field Laboratory (SSFL) from two outfall monitoring locations. The locations were the former Radioactive Materials Handling Facility (RMHF, Outfall 003) and Perimeter Pond (Outfall 011) (Figure 1). Sampling and analyses performed to satisfy the Section 13267 requirements were completed coincident with sampling and analyses performed to satisfy the requirements of Boeing's National Pollutant Discharge Elimination System (NPDES) monitoring and reporting program. Data provided in this Technical Report was previously reported, along with all other surface water sampling data, to the RWQCB in past quarterly NPDES Discharge Monitoring Reports (DMRs). This Technical Report only contains data collected to date as required pursuant to the 2004 Section 13267 request. As noted in the attached document we are unable to complete the dry weather sampling and we are waiting on direction from your office.

Please contact Mr. Paul Costa of my staff at (818) 466-8778 if you have questions or comments regarding the contents of this technical report.

Sincerely,

A handwritten signature in black ink, appearing to read 'T. D. Gallacher', written over a horizontal line.

Thomas D. Gallacher, Director  
SSFL - Safety, Health & Environmental Affairs

PJC:bjc

Attachment: October 2006 Technical Report Results

**The Boeing Company  
Santa Susana Field Laboratory**

**Results of the  
Evaluation of Grab Versus Flow Weighted Samples  
and  
Evaluation of Filtered Versus Unfiltered Samples for Radionuclides  
October 2006**

**Introduction**

In a May 20, 2004 letter (Attachment 1), the RWQCB requested Boeing to conduct a special study of surface water runoff at the SSFL. This study was required pursuant to Section 13267 of the California Water Code with the intent of providing information to the RWQCB regarding the quality of water leaving SSFL during rain events and dry weather discharges. Specifically, the letter requested Boeing to conduct two special studies. Study 1 was to compare the results of grab sampling versus flow-weighted composite sampling of surface water run-off. Study 2 was to compare the results of filtered and unfiltered surface water samples that were analyzed for radiological constituents. Boeing submitted a Technical Workplan (Workplan) on August 31, 2004 that outlined the details of the two studies (Attachment 2), and commenced sampling in accordance with the Workplan, in early January 2005.

The January 12, 2005 RWQCB response (Attachment 3) to the Workplan indicated that the Workplan had sufficiently addressed the issues for Study 1. However, in their response, the RWQCB provided clarification and comment on the Study 2 portion of the 13267 request. Furthermore, a subsequent RWQCB letter dated March 22, 2005 (Attachment 4) provided additional clarification on the protocols and requirements of Study 2. Therefore, Boeing submitted a revised Technical Workplan (Revised Workplan) to the RWQCB, dated April 25, 2005 (Attachment 5) to address the RWQCB January 12 and March 22, 2005 comments. Summaries of Study 1 and Study 2 are presented below.

**Study 1 -- Grab versus Composite Sampling**

Overview of Study

This study consisted of six sampling events at the weir immediately downstream from Perimeter Pond (Outfall 011). Three were to occur during wet weather discharges and three during dry weather discharges. Each sampling event was to include the collection of a grab sample during the first 30 minutes of discharge and a flow-weighted composite sample over the course of the first three hours of flow or for the duration of the discharge if less than three hours. The constituents to be analyzed were specified in the May 20, 2004 RWQCB letter (Attachment 1).

Grab Sampling

Field personnel collected the grab samples following methodologies outlined in Chapter 3 of the Environmental Protection Agency's (EPA's) July 1992 NPDES Storm Water Sampling Guidance Document (Guidance Document). Samples were collected and

stored in appropriate laboratory-provided bottles under prescribed temperature conditions following EPA methodologies. Samples were transferred via laboratory courier to an approved EPA Certified Laboratory (laboratory) for analysis using standard chain of custody (COC) forms for proper handling documentation.

#### Composite Sampling

Surface water samples were collected for flow-weighted compositing from the same location as indicated above. For consistency in comparing flow-weighted composite sample results with grab sample results, the grab samples noted above were collected at approximately the same time as the first aliquot for the composite sample. Composite samples were also collected and stored according to methodologies outlined in the Guidance Document. Composite sampling took place over a three-hour period or for the duration of the flow event, and was composed of equal aliquots of sample volume collected approximately every 15 minutes for the duration of the sampling period. Individual aliquot volumes were approximately 2 gallons, and when composited, the total volume was sufficient to complete analyses of all required parameters. Samples were transferred via laboratory courier to an approved laboratory for analysis using standard COC forms for proper handling documentation.

The amount of sample from each aliquot that was used to make up the composite sample was determined based on the proportion of flow during each sampling interval versus the total flow during the sampling event. Flow data from an ISCO Model 4210 Ultrasonic Flow Meter was used to determine aliquot amount. The composite samples, using the individual aliquots and flow data provided, were prepared and analyzed at the laboratory.

#### Wet Weather Storm Water Sampling

Wet weather storm water sample collection at Outfall 011 was initially performed on January 4, and repeated on January 11, February 11, February 25, March 18, and March 25, 2005. Grab samples were collected in the same manner in which they are collected for the NPDES program. Composite sampling occurred over a period of approximately three hours for each event. The laboratory was to perform the flow-weighted compositing portion of the study by taking a quantity of water from each container, based on the flow volume during the sample collection period, and mixing that proportional quantity of water from each container for that flow volume interval.

Initially, the laboratory inadvertently composited the storm water samples for the January 4 and 11, and February 11, 2005 sampling events by taking equal quantities of water from each container and mixing them into a combined sample for each respective sampling day. This resulted in a time-weighted average sample, not a flow-weighted average sample. Upon becoming aware of the erroneous procedure, Boeing collected additional surface water samples from Outfall 011 on February 25, and on March 18 and 25, 2005 to perform flow-weighted averaging. The time-weighted average results from these wet weather-sampling events were not used to fulfill the requirements of the 13267 request. These additional samples were flow-weighted and composited by the

laboratory based on flow volume during the sample collection period. Samples from these three events met the requirements of Study 1 for wet weather.

Table 1 presents the results from the Study 1 samples collected that met the requirements of wet weather sampling. The samples that were inadvertently analyzed as time-weighted samples are included in Appendix A, in a comprehensive data summary table that includes all Study 1 sampling results.

#### Dry Weather Water Sampling

As referenced on Page 5 of the Fact Sheet in the 2004 NPDES Permit (and in subsequent Permits issued), Boeing uses a water management program at the SSFL. This water management program, along with the reduced introduction of water from onsite activities, has significantly reduced the frequency of both wet and dry weather discharges from Outfall 011. Although the procedure for dry weather discharge sampling would have been the same as the wet weather procedure, there has not been a dry weather discharge at Outfall 011 since the RWQCB's May 20, 2004 letter was issued. Therefore, the three dry weather discharge samples to be collected and analyzed could not be collected or analyzed. Boeing notified the RWQCB that the dry weather discharge samples could not be collected, and the RWQCB directed Boeing to submit this technical report without the dry weather data.

#### Reporting of Study 1 Sample Analyses

Table 1 provides a summary of the analytical results that meet the requirements for Study 1. Study 1 results are included herein without the other NPDES Permit-required routine surface water results. The routine surface water analytical results have been previously reported, with corresponding laboratory analytical reports appended, to the RWQCB in the respective quarterly DMRs. For thoroughness, those samples that were collected and analyzed that did not meet the requirements of the RWQCB 13267 request (e.g. the inadvertently composited time-weighted samples, discussed above) are included in Appendix A. Appendix A also contains the analytical laboratory reports for Study 1.

### **Study 2--Sampling for Radiological Components**

#### Overview of Study

Study 2 was to facilitate the comparison of ten storm water samples analyzed for radiological constituents. Each of the collected samples was to be analyzed prior to and after filtering took place in the laboratory. As stated in the May 20, 2004 RWQCB letter, a minimum of four of the samples were to be obtained from the RMHF facility (Outfall 003). The other six samples could be obtained while completing Study 1 at Perimeter Pond, using the wet and dry weather grab samples from that study.

Based on the Workplan submitted, Boeing commenced sampling in early January 2005. However, the RWQCB's January 12 and March 22, 2005 responses to the Workplan (Attachments 3 and 4) provided additional clarification and comments on the Workplan.

Therefore, Boeing collected additional samples during subsequent storm events to meet the additional study modifications requested by the RWQCB.

### Study 2 Sampling and Analyses

Data for Study 2 initially included results from a total of nine sampling events. Samples were collected from Outfall 003 on January 4, February 11 and 18, March 19, and April 28, 2005 (additional samples were collected from Outfall 003 on October 18 and November 9, 2005, and on January 1, February 19, March 1, and March 11, 2006 to satisfy NPDES Permit requirements related to Strontium-90 [as discussed below]). Samples were collected from Outfall 011 on February 11 and 25, and March 18 and 25, 2005. However, similar to Study 1, some initial samples were collected prior to the RWQCB's January 12 or March 22, 2005 letters and, therefore, these samples were not considered adequate to satisfy the requirements of Study 2. The four samples collected from Outfall 003 on February 11 and 18, March 19, and April 28, 2005, and the three samples collected from Outfall 011 on February 25, and March 18 and 25, 2005 were used to satisfy the requirements of Study 2. Table 2 presents the results from the Study 2 samples collected that met the requirements of the study. The samples that were collected from Outfall 003 on January 4 and Outfall 011 on February 11, 2005 that were not used to fulfill the study requirements are included in Appendix A.

Study 2 sampling and analysis consisted of collecting two equal aliquots of surface water per monitoring event and performing analyses according to the RWQCB's request. One aliquot was analyzed unfiltered. Per RWQCB direction, the unfiltered sample was not acidified prior to analysis. The second aliquot was filtered at the laboratory prior to acidification and analysis. A 0.45-micron filter was weighed and tared prior to filtration. The filtered aliquot was then acidified prior to analysis. Both the filtered and unfiltered samples were analyzed for Gross Alpha, Gross Beta, Radium 226 & 228, Tritium, and Strontium-90. As required by the RWQCB, the filter and substrate (the solid material remaining in the filter) from the filtered sample were subsequently analyzed for Cesium-137 using Gamma Spectroscopy.

The surface water sample collected from Outfall 003 on April 28, 2005 that was analyzed for the constituents as part of Study 2 exceeded the established NPDES permit limit for unfiltered Strontium-90. Therefore, as required in the NPDES Permit, additional surface water samples were collected during subsequent flow events from Outfall 003 and analyzed for Strontium-90. The subsequent samples collected on November 9, 2005, and January 1, February 19, March 1, and March 11, 2006 did not contain Strontium-90 at concentrations greater than the NPDES Permit limit. The results of these additional unfiltered Strontium-90 analyses are included in this report in Appendix A.

### Dry Weather Water Sampling

As stated above in reference to the grab sample versus composite sample Study 1, although the procedure for dry weather discharge sampling would have been the same as the wet weather procedure, there has not been a dry weather discharge at Outfall 011 since the RWQCB's May 20, 2004 letter was issued. Therefore, the three dry

weather discharge samples that would have been used to fulfill the requirements of Study 2 could not be collected and analyzed.

#### Reporting of Study 2 Sample Analyses

Table 2 provides a summary of the analytical results that meet the requirements for Study 2. Study 2 results are included herein without the other NPDES Permit-required routine surface water results. The routine surface water analytical results have been previously reported, with corresponding laboratory analytical reports appended, to the RWQCB in the respective quarterly DMRs. For thoroughness, those samples that were collected and analyzed that did not meet the requirements of the RWQCB 13267 request (e.g. those collected and analyzed before receiving final comments on the Workplan from the RWQCB) are included in Appendix A. Appendix A also contains the analytical laboratory reports for Study 2.

Prior to the date of this letter, the total combined radium (TCR) values were reported in a similar format to chemical data, which is amenable to evaluating reporting limits and permit limit compliance. This methodology, applied consistent with the intent of the NPDES Permit, may yield different total combined radium concentrations than the methodology described below (and the methodology used in the Total Combined Radium Addendum summary data sheets (as part of Table 2 and in Appendix A). For consistency and accuracy, and to preserve the true meaning and intent of the data, future data of this type will be reported as reported herein in Table 2 and Appendix A. This does not imply a change in the way constituents are measured. Previously used methodologies and individual measurement results used for reporting purposes have been submitted in the DMRs on a quarterly basis for independent review or comment dating back to February 2005. To summarize, the previously used methodology was:

If both the radium 226 and radium 228 results were non-detected values, then the TCR was "ND" at the lowest minimum detectable activity (MDA).

If one of the radium 226 and radium 228 results was ND and the other was a detected value, then the TCR was equal to the detected value. The reported TCR MDA was equal to the MDA associated with the detected value.

If both the radium 226 and radium 228 results were detected values, then the TCR was equal to the sum of the two values. Likewise, the TCR MDA was equal to the sum of the two MDAs.

The Total Combined Radium Addendum data summary sheets in Table 2 and in Appendix A provide explanation and formulas for calculating TCR (which is the result or the measured value [MV]), the MDA, and the potential error range (plus or minus) in the result. Variances in TCR values are included for the reasons described above and are shown in the tables of this submittal. The values presented in the Total Combined Radium Addendum data summary sheets should be used for the purposes of this study.

## **Summary**

In accordance with RWQCB requirements, Boeing implemented the Section 13267 study to evaluate potential analytical result variations in grab and composite sampling methodologies, and in pre-analytical testing procedures for radiological analysis (filtering and not filtering prior to radiological analysis). With the exception of collecting storm water samples during three dry weather discharges at Perimeter Pond (Outfall 011), because there were no dry weather discharges at Perimeter Pond during the study period, the requirements of the field portions of the studies have been fulfilled. With a decrease in onsite operations, and surface water management programs in place, Boeing does not anticipate that dry weather discharges will occur at Outfall 011 in the future. Based on this, the dry weather portion of the study cannot be completed. Therefore, based on discussion with the RWQCB, submittal of this technical report and associated supporting figure, tables, laboratory reports, and prior correspondence, fulfills the requirements of the May 20, 2004 RWQCB Section 13267 request.

**13267 TECHNICAL REPORT SUMMARY NOTES  
THE BOEING COMPANY  
SANTA SUSANA FIELD LABORATORY  
NPDES PERMIT CA0001309**

**Notes:**

1. For Dioxins and Furans, laboratory results may have been reported in picograms/liter (pg/L). However, the permit limit is stated in micrograms/liter (µg/L). To evaluate permit compliance, the laboratory results have been converted to µg/L, as necessary, to calculate the TCDD TEQ.
2. TCDD TEQs for the purpose of determining permit compliance are the sum of the products of the detected dioxin congener concentration multiplied by that congener's TEF. The resulting compliance TCDD TEQ does not include those congener concentrations that are reported as DNQ, as specified on Page 46 of the NPDES permit.
3. For some sample dates, pH was determined with a field instrument and was noted as such. These results were not validated. Since pH does not have an RL, the possible pH range is shown in the RL column.
4. The NPDES permit limits for mercury of 0.10 µg/L (Outfalls 1-2) and 0.13 µg/L (Outfalls 3-7) are not achievable by the laboratory; therefore, the laboratory reporting limit of 0.20 µg/L was used to determine compliance.
5. The volume discharged at the Alfa Test Stand (Outfall 012) is estimated based on the run time of the test.
6. For mass based results, the following assumptions and rationale were used:  
Daily Constituent Mass (lbs/day) = Constituent Concentration (mg/L) x 8.34 x Measured Outfall Flow (mgd) during the Flow Event.  
  
Monthly Average Constituent Mass (lbs/day) = Sum of all Daily Constituent Mass within a calendar month / Total Number of Days Flow Events Occurred during that month.
7. In calculating monthly average, one-half of the MDL was used for concentration results reported as ND. The estimated value was used for concentration results reported as DNQ. If all pollutants belonging to the same group are reported as ND or DNQ, the sum of the individual pollutant concentrations were considered zero for calculation of the monthly average.
8. All of the following abbreviations and/or notes may not occur on every table.

---

-92.9 +/-200	A negative radiochemical analytical result indicates the count rate of the sample was less than the background condition
\$	reported result or other information was incorrectly reported by the laboratory;
--	result was corrected by the data validator
-/-	based on validation of the data, a qualifier was not required
<(value)	no permit limit established for daily maximum or monthly average
*	analyte not detected at a concentration greater than or equal to the DL, MDL, or RL (see laboratory report for specific detail)
*1	result not validated
*	improper preservation of sample

**13267 TECHNICAL REPORT SUMMARY NOTES  
THE BOEING COMPANY  
SANTA SUSANA FIELD LABORATORY  
NPDES PERMIT CA0001309**

*2	the ICP/MS ppb check standard was recovered above the control limit; therefore, the constituent detected was qualified as estimated (J)
*3	initial and or continuing calibration recoveries were outside acceptable control limits
*4	Extractable Fuel Hydrocarbon (EFH) recovery was above control limit in the blank spike only and relative percent difference for the EFH blank spike/blank spike duplicate pair exceeded the quality control (QC) limit of <-25%
*5	blank spike/blank spike duplicate relative percent difference was outside the control limit
*7	BOD results were estimated due to method derivation
*10	value was estimated detect or estimated non detect (J,UJ) due to deficiencies in quantitation of the constituent including constituents reported by the laboratory as Estimated Maximum Possible Concentration (EMPC) values
*11	no calibration was performed for this compound; result is reported as a tentatively identified compound (TIC)
ANR	analysis not required; e.g., constituent or outfall was not required by the permit to be sampled and analyzed (annual, semi-annual, etc.)
B	laboratory method blank contamination
C	calibration %RSD or %D were noncompliant
C5	Calibration verification %R was outside method control limits
D	analysis with this flag should not be used because another more technically sound analysis is available
%D	percent difference between the initial and continuing calibration relative response factors
deg F	degrees Fahrenheit
DL	detection limit
DNQ	detected but not quantified (constituent value greater than or equal to the laboratory method detection limit and less than the laboratory reporting limit)
E	duplicates show poor agreement
H	holding time was exceeded
I	ICP interference check solution results were unsatisfactory
J	estimated value
K	The sample dilution's set-up did not meet the oxygen depletion criteria of at least 2 mg/l. Therefore, the reported result is an estimated value only.
L2	the laboratory control sample %R was below the method control limits
L	laboratory control sample %R was outside control limits
LOD	limit of detection
M1	matrix spike (MS) and/or MS duplicate were above the acceptance limits due to sample matrix interference
M2	the MS and/or MS duplicate were below the acceptance limits due to sample matrix interference
M-3	Results exceeded the linear range in the MS and/or MS duplicate and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).
MDA	minimum detectable activity
MDL	method detection limit
MGD	million gallons per day
mg/L	milligrams per liter
ml/L/hr	milliliters per liter per hour

Total Combined Radium-226 & Radium 228 (unfiltered)	pCi/L	5.0/-	1.318 ± 0.370	0.777	1.249 ± 0.361	0.768	J (H)

Note:

Total Combined Radium values were calculated specifically for this report following the procedures outlined in the text and below. Any of these data used for NPDES permit compliance purposes may have appeared different in previously reported documents. Neither method of calculation results in potential permit limit exceedances.

Irrespective of whether or not one or more radium-226 or radium-228 measured values are non-detect, the following rules were followed in calculating total combined radium (TCR) data.

**Measure Value (MV)**

$$MV_{Ra-226+Ra-228} = MV_{Ra-226} + MV_{Ra-228}$$

**Minimum Detectable Activity (MDA)**

$$MDA_{Ra-226+Ra-228} = MDA_{Ra-226} + MDA_{Ra-228}$$

**2-Sigma Error (2σ)**

$$2\sigma_{Ra-226+Ra-228} = 2 * ( (2\sigma_{Ra-226}/2)^2 + (2\sigma_{Ra-228}/2)^2 )^{0.5}$$

See attached notes for abbreviations, definitions and other explanations for the data presented.

Mr. Steve Lafflam, Division Director  
Safety, Health & Environmental Affairs  
The Boeing Company  
P.O. Box 7922  
Canoga Park, California 91309

Dear Mr. Lafflam:

## REQUIREMENT TO SUBMIT A TECHNICAL REPORT PURSUANT TO SECTION 13267 OF THE CALIFORNIA WATER CODE - BOEING COMPANY, SANTA SUSANA FIELD LABORATORY, CANOGA PARK (NPDES NO. CA0001309, CI NO. 6027)

As you are aware, comments received by the Regional Board during the development of the revised tentative National Pollutant Discharge Elimination System (NPDES) requirements have resulted in a review of the sampling protocols utilized for stormwater constituents and radionuclides in wastewater at the Santa Susana Field Laboratory (SSFL). The protocols for sample collection that are stipulated in the Monitoring and Reporting Requirements for storm water runoff are based on the *NPDES Storm Water Sampling Guidance Document* which was issued by United States Environmental Protection Agency (USEPA). The USEPA methods specified for the analysis of the radiochemicals are those typically used for drinking water by the California Department of Health Services. As a result of questions raised in comments submitted on the tentative requirements and during the May 6, 2004, Board Meeting, the Regional Board has determined that an additional study would provide valuable information regarding the transport of contaminants offsite in storm water runoff and regarding the effects of filtering on the samples analyzed for radiochemicals. In addition, it would confirm that current sampling procedures result in representative samples. Pursuant to Water Code section 13267, the Regional Board may require Dischargers subject to waste discharge requirements to furnish technical or monitoring reports in order to determine the effect of discharge on the water quality.

Therefore, pursuant to section 13267 of the California Water Code, you are hereby directed to submit a technical report. In this case, you are required to submit a detailed technical workplan to conduct the following sampling and analyses. The workplan, at a minimum, should describe the protocol for the following activities:

1. Sampling and analysis at Perimeter Pond during dry weather discharges and wet weather discharges for six sampling events, starting with the first storm event of the 2004-2005 rainy season and the subsequent two discharge events. A grab sample shall be collected during the first 30 minutes of discharge and a flow-weighted average sample shall be collected during the first three hours of discharge of the same discharge event, or for as long as the discharge occurs if it is less than three hours. The three dry weather samples are also to be collected

001468 RC

RECEIVED MAY 24 2004

Santa Susana Field Laboratory

- 2 -

May 20, 2004

from the Perimeter Pond discharge, a grab and a flow-weighted average sample during each discharge event. The samples are to be analyzed for all of the constituents listed in the attached Table 1.

2. Ten samples shall be collected and analyzed for Gross Alpha, Gross Beta, combined Radium 226 & Radium 228, Tritium, and Strontium-90. Six of the grab samples collected from the Perimeter Pond may be used for this analysis. The other four samples must be collected from Outfall 003 (former Radioactive Materials Disposal Facility) during rain event discharges. Sampling shall occur during the first hour of discharge or at the first safe opportunity. The reason for delay shall be included in the report. The samples must be split and one half of the sample filtered. The unfiltered and filtered samples (including the filtrate) are to be analyzed for the radionuclides listed above, utilizing the methods specified in Table 1.

The workplan to conduct the required sampling and analyses is due to the Regional Board by August 31, 2004. If you have any questions, please contact Cassandra Owens at (213) 576-6750.

Sincerely,

Dennis A Dickerson,  
Executive Officer

Acute toxicity	% survival	grab	once per discharge event
Chronic toxicity	TU <sub>c</sub>	grab	once per discharge event

<sup>2</sup> Total recoverable results are required.

<sup>3</sup> The Discharger has the option to meet the hexavalent chromium limitations with a total chromium analysis. However, if the total chromium level exceeds the hexavalent chromium limitation, it will be considered a violation unless an analysis has been made for hexavalent chromium in replicate sample and the result is reported within the hexavalent chromium limits.

<sup>4</sup> Analyze these radiochemicals by the following USEPA testing methods: method 900.0 for gross alpha and gross beta, method 903.0 or 903.1 for radium-226, method 904.0 for radium-228, method 906.0 for tritium, and method 905.0 for strontium-90.

<sup>5</sup> Analysis for combined Radium-226 & 228 shall be conducted only if gross alpha results for the same sample exceed 15 pCi/L or beta greater than 50 pCi/L. If the Radium-226 & 228 exceeds the stipulated criteria analyze for Tritium and Strontium-90. If the analyses of these constituents demonstrates exceedances the monitoring frequency is increased to once per discharge until four consecutive analysis demonstrates compliance with the effluent limitations.

<sup>6</sup> Total petroleum hydrocarbons includes all fuels, gasoline, diesel and jet fuel. Analysis should be completed using EPA 418.1 and EPA 8015 (modified) methods.

<sup>7</sup> Analysis shall include xylenes and trichlorofluoromethane.

**Subject: Submission of Technical Workplan Pursuant to Section 13267 of the California Water Code Boeing Company, Santa Susana Field Laboratory Canoga Park, California (NPDES Permit No. CA0001309)**

Dear Ms. Owens:

The Boeing Company (Boeing) is submitting a Technical Workplan pursuant to Section 13267 of the California Water Code and as requested by the California Regional Water Quality Control Board, Los Angeles Region (RWQCB) in a letter dated May 20, 2004. This Technical Workplan describes the protocol for additional sampling and analyses activities at the Santa Susana Field Laboratory (SSFL). This required sampling is in conjunction with current National Pollutant Discharge Elimination System (NPDES) sampling conducted at the SSFL as required under permit number CA0001309.

If there are any questions pertaining to this Workplan, please contact Bill McIvaine at (818) 586-9228.

Sincerely,

Paul J. Costa, Manager  
Environmental Protection

SHEA-100496

**The Boeing Company  
Rocketdyne Propulsion & Power**

**Technical Workplan to Investigate Surface Water Run-off Leaving the Santa  
Susana Field Laboratory**

**Overview of the Technical Study Requirements**

On May 20, 2004 The Boeing Company received a letter from the Los Angeles Regional Water Quality Control Board (Board) requiring Boeing to conduct a special study of surface water runoff at the Santa Susana Field Laboratory. This study was required pursuant to Section 13267 of the California Water Code and its intent is to provide information to the Board regarding the quality of water leaving SSFL during rain events and dry weather discharges. Specifically this letter required Boeing to conduct two special studies. The first is to compare the results of grab sampling versus flow weighted composite sampling of surface water run-off. The second is to compare the results of radiological samples that have been filtered and unfiltered prior to analysis. Boeing was required to submit a technical workplan (workplan) by August 31, 2004 that outlines the details of these two studies. The following workplan is intended to meet this requirement and will become effective once it has been approved by Board staff.

**Study 1. Composite versus Grab Sampling**

Overview of Study:

The Board requires this study to consist of six sampling events at Perimeter Pond (Outfall 011). Three are to occur during wet weather discharges and three during dry weather discharges. Each sampling event is to include collecting a grab sample during the first 30 minutes of discharge and a flow-weighted composite sample that is to be collected over the course of the first three hours of flow or for the duration of the discharge if less than three hours. The constituents to be analyzed have been specified in the Board letter and are included in Table 1. of this workplan.

General Sampling Protocols:

Wet weather sample collection will commence at Perimeter Pond (Outfall 011) upon the first storm event that produces sufficient flow for complete analyses. Wet weather sample collection will continue for the two subsequent rain events that produce sufficient flow. The sample collection point will be located at the weir immediately downstream from Perimeter Pond and be will representative of all surface water that comes from the eastern portion of the Santa Susana Field Lab including that which flows through Perimeter pond. Sampling will continue through the dry season(s) until three additional samples of dry weather discharge have been collected. It should be noted that as referenced on page 5 of the Fact Sheet for NPDES Permit No. CA0001309, water may be transferred from Perimeter Pond to the R-1 Pond and then

up to the Skyline Tank Farm for reuse as engine test cooling water or released to Silvernale pond as needed. This water management program along with the reduced introduction of water from ongoing activities will reduce the frequency of both wet and dry weather discharges from this sampling location. It is therefore possible that meeting the sampling requirements for this portion of the study may take several years. It should also be noted that prior to sampling, an evaluation will take place to identify potential safety issues. Such factors considered would include the amount of ambient light, road conditions, and potential for flash flooding. Samples may not be collected within the prescribed time if it has been determined that doing so may jeopardize the safety of field personnel. In such cases, sample collection will begin as soon as it is safe to do so. If such a delay occurs, an explanation as to the reason for the delay will be noted in technical report submission.

Grab Sampling Methodology:

Field personnel will collect the grab samples following methodologies outlined in Chapter 3 of the EPA's July 1992 NPDES Storm Water Sampling Guidance Document (Guidance Document). An excerpt of this document has been enclosed for your review. Samples will be stored in appropriate bottles under prescribed temperature conditions following EPA methodologies. An outside courier will transport the samples to a State Certified Analytical Laboratory for analysis using standard chain of custody forms to document proper handling.

Composite Sampling Methodology:

Flow weighted samples will be collected from the same location at Perimeter Pond as the grab samples. For this portion of the study, samples will be collected utilizing an automatic sampler that is capable of refrigerating the samples until collected by field personnel. For consistency in comparing grab sample results with flow weighted composite samples results, the grab sample noted above will be collected at approximately the same time taken first aliquot for the composite sample is taken. Composite samples will also be collected and stored according to methodologies outlined in the Guidance Document. Sampling will take place over a three hour period or for the duration of the flow event whichever is shorter. During this time and also in accordance with the Guidance Document, three equal aliquots of sample will be collected per hour at equal time intervals. Aliquot volumes will be sufficient to complete analyses of all required parameters. It is expected that each aliquot will contain approximately 2 liters of liquid which will be used for flow proportioning.

The amount of sample from each aliquot that will be used to make up the composite sample will be calculated using the formula expressed in Exhibit 3-23 and 3-24 of the Guidance Document as applicable. Flow data from an ISCO model 4210 Ultrasonic flow meter which has been installed at the sample point will be used for determination of aliquot amount. The flow meter was calibrated in July 2004 to assure accurate measurements, and will be re-calibrated on an annual basis. The formation of the composited sample using the individual aliquots and flow data will either be performed in the field or at the laboratory depending upon environmental conditions. A

courier will transport the resultant samples to a State Certified Analytical Laboratory for analysis using standard chain of custody forms to document proper handling.

The automatic sampler will only be used for those analyses amenable to such collection techniques as noted in exhibit 3-23 of the Guidance Document. For analytes that are not amenable to collection by automatic samplers, (i.e.: VOCs) samples will be manually collected by field personnel using proper collection containers at equal intervals and will be stored per requirements for compositing either in the field or at the laboratory per Guidance Document specifications.

## **Study 2. Sampling for Radiological Components**

### Overview of Study

This second study requires the collection and analysis of ten samples for Gross Alpha, Gross Beta, combined Radium 226 & Radium 228 (if analytical results require it), Tritium, and Strontium-90. Each sample is to be split into two halves, with one portion being filtered and analyzed while the other portion being left intact prior to analysis. Sampling is to be conducted using the specified EPA radiological methodologies as directed by the Board and is included in Table 1.

### Sampling Methodology:

Data for this study will include results from a total of ten sampling events. A minimum of four of the samples will be taken from the RMHF facility (Outfall 003). The other six samples will be the same samples from the first study conducted at Perimeter Pond. All will be grab samples collected during the first hour of discharge or at the first safe opportunity. Any delays in sampling will be detailed in the final report. Each grab sample will be split into two equal aliquots after mixing. One aliquot will be submitted to the laboratory unfiltered. The second aliquot will be filtered using a 0.45 micron filter. Both samples along with the filtrate from the filtered aliquot will be transported by courier to a State Certified Analytical Laboratory for analysis using standard chain of custody forms to document proper handling.

Each resultant sample including the filtrate will be analyzed for the following:

Gross Alpha (using EPA Method 900.0)

Gross Beta (using EPA Method 900.0)

Radium-226 (using EPA Method 903.0 or 903.1 if required)

Radium-228 (using EPA Method 904.0 if required)

Tritium (using EPA Method 906)

Strontium-90 (using EPA Method 905.0)

It should be noted that the EPA Method 900.0 for Gross Alpha is designed for water with low suspended solids and turbidity. Samples with more than 100 mg/l of solids or greater than 5.0 NTU turbidity will likely raise the detection limits due to the limitations of the method. The detection limit for each sample will be included in the report.

### **Reporting of Results**

Since these analyses are being performed on samples taken from locations regulated under NPDES Permit No. CA0001309, sampling results will be submitted in Boeing's quarterly Self Monitoring Report (SMR). Sample results from modified procedures (flow weighted and filtered samples) will be summarized in a special section that will be submitted along with the quarterly SMR. In the event there was insufficient flow to support this study in the reporting quarter, a notation will be made in the report. Boeing assumes that those samples undergoing analyses required in the NPDES permit will be subject to permit requirements including the 24 hour notification required under Section III. A of the WDRs in the existing NPDES permit (CA0001309). Boeing also assumes that those samples which deviate from normal sampling methodologies as specified in the NPDES permit would not be used for compliance determination. This would include the composite sample results.

Upon completion of all required sampling and analysis, a Final Technical Report will be prepared and submitted to the RWQCB. The Technical Report will include a summary of sampling activities, summary of analytical results, and supporting laboratory data sheets.

# NPDES Storm Water Sampling Guidance Document

## DISCLAIMER

This document was issued in support of EPA regulations and policy initiatives involving the development and implementation of a national storm water program. This document is agency guidance only. It does not establish or affect legal rights or obligations. Agency decisions in any particular case will be made applying the laws and regulations on the basis of specific facts when permits are issued or regulations promulgated. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

### 3.2.5 REPORTING STORM WATER DISCHARGE FLOW RATES AND VOLUMES

Form 2F requires applicants to provide quantitative data (reported both as concentration and as total mass) based on flow-weighted samples collected during storm events. In addition, applicants are required to provide flow estimates or flow measurements, as well as an estimate of the total volume of the discharge. The method of flow estimation or measurement must be described in the application. Although EPA only requires flow estimates in Form 2F, accurate flow measurement is necessary for collecting representative flow-weighted composite samples and reporting pollutant mass loadings.

### 3.2.6 MEASURING RAINFALL

Many types of instruments have been developed to measure the amount and intensity of precipitation. All forms of precipitation are measured on the basis of the depth of the water that would accumulate on a level surface if precipitation remained where it fell. There are two types of rain gauges -- standard and recording gauges. A standard rain gauge collects the rainfall so that the amount of rain can be easily measured. The standard gauge for the NWS has a collector which is 8 inches in diameter. Rain flows from the collector into a cylindrical measuring tube inside the overflow can. The measuring tube has a cross-sectional area one tenth the size of the collector so that 0.1 inch of rainfall will fill 1 inch of the measuring tube. While this standard gauge is both accurate and easy to use, any open receptacle with vertical sides can be an effective rain gauge. Standard rain gauges are simple and inexpensive; however, with a standard gauge, there is no way to record changes in the intensity of the rainfall without making frequent observations of the gauge during the storm.

The second type of gauge is the recording rain gauge, which provides a permanent record of the amount of rainfall which accumulates over time. Three common types of recording gauges are:

- Tipping Bucket Gauge - Water caught in a collector is funneled into a two-compartment bucket; a known quantity of rain fills one compartment, overbalancing the bucket and emptying it into a reservoir. This moves the second bucket into place beneath the funnel. The tipping of the bucket engages an electric circuit, which records the event.
- Weighing Type Gauge - Water is weighed when it falls into a bucket placed on the platform of a spring or lever balance. The weight of the contents is recorded on a chart, showing the accumulation of precipitation.
- Float Recording Gauge - Water is measured by the rise of a float that is placed in the receiver. These gauges may be self-siphoning, or may need to be emptied periodically by hand.

Recording rain gauges provide a permanent record of rainfall, and they can be used to determine variations in rainfall intensity over time without making frequent observations during the storm. But recording gauges are more complicated mechanically than standard gauges, making them more costly, less durable, and more difficult to operate.

Although all gauges are subject to error, most errors can be minimized. To minimize errors, the gauge should be placed on a level surface that is not windswept and is away from trees or buildings that might interfere with the path of rainfall. When taking measurements, other factors contributing to error should also be considered: mistakes in reading the scale, dents in the collector rim (which changes the receiving area), measuring sticks that may retain some of the water, and water lost to evaporation. In the case of tipping bucket gauges, water may not be collected while the bucket is still tipping. The most common source of inaccuracy is changes in data that are attributable to wind. It is possible to assess wind errors by comparing measurements of gauges that are protected from the wind with those that are not.

### 3.3 GRAB SAMPLE COLLECTION

Section 3.1.2 discussed both the parameters that must be monitored by grab sample and the conditions under which grab sampling is required. This section explains how to collect grab samples. The entire sample is collected at an uninterrupted interval (i.e., grabbed at one time). A grab sample provides information on the characterization of storm water at a given time and may be collected either manually or automatically as discussed below.

#### 3.3.1 HOW TO MANUALLY COLLECT GRAB SAMPLES

A manual grab is collected by inserting a container under or downcurrent of a discharge with the container opening facing upstream. Generally, simplified equipment and procedures can be used. In most cases, the sample container itself may be used to collect the sample. Less accessible outfalls may require the use of poles and buckets to collect grab samples. To ensure that manual grab samples are representative of the storm water discharged, the procedures set forth in Exhibit 3-17 should be followed.

**EXHIBIT 3-17. RECOMMENDED OPERATING PROCEDURES FOR TAKING GRAB SAMPLES**

- Label sample containers before sampling event
- Take a cooler with ice to the sampling point
- Take the grab from the horizontal and vertical center of the channel
- Avoid stirring up bottom sediments in the channel
- Hold the container so the opening faces upstream
- Avoid touching the inside of the container to prevent contamination
- Keep the sample free from uncharacteristic floating debris
- Transfer samples into proper containers (e.g., from bucket to sample container), however, fecal coliform, fecal streptococcus, phenols and O&G should remain in original containers
- If taking numerous grabs, keep the samples separate and labelled clearly
- Use safety precautions (see Chapter 6)

Specialized equipment and procedures may be needed, particularly in situations where storm water discharges are inaccessible or where certain parameters are monitored. For example:

- When sampling for O&G and VOCs, equipment that safely and securely houses O&G bottles or VOC vials should be used. This may be necessary because: (1) O&G will adhere to containers and thus should not be transferred from one container to another; and (2) excessive aeration during sampling may result in the partial escape of VOCs.
- Since facilities sometimes use sample bottles that already contain preservatives (as provided by contract laboratories), extreme care should be taken when filling them to avoid spills, splatters, or washout of the preservatives.

All equipment and containers that come into contact with the sample must be clean to avoid contamination. Additionally, sample collection equipment and container materials should be totally unreactive to prevent leaching of pollutants. Cleaning procedures are discussed in detail in Section 3.5.

### 3.3.2 HOW TO COLLECT GRAB SAMPLES BY AUTOMATIC SAMPLER

Grab samples can also be collected using programmed automatic samplers. Automatic samplers come equipped with computers that can be programmed to collect grab samples. Programming for grabs is specific to the type of automatic sampler. Some samplers are portable and have been developed specifically to sample for storm water discharges. These samplers are frequently attached to a rain gauge and/or a flow sensor. Such samplers can be programmed to initiate sample collection by one or more of the following conditions: (1) depth of flow in a channel; (2) rainfall in inches; (3) flow rate; (4) time; (5) external signal; and (6) combinations of the first three conditions. For example, an automatic sampler could be used to collect a sample at 15-minute intervals after its sensors indicate that rainfall has begun.

When using an automatic sampler, planning is very important. First, all equipment must be properly cleaned, particularly the tubing and the sample containers. There are several different types of tubing available, including rubber and Tygon tubing. Tygon tubing is commonly used since it generally does not leach contaminants. Deionized water should be drawn through the sampler to remove any remaining pollutant residuals prior to taking samples. Tubing should also be replaced periodically to avoid algae or bacterial growth.

Sampling personnel should also use adequate and appropriate containers and ensure they are properly cleaned. Section 3.5 contains information on cleaning procedures which should be followed for all equipment. Additionally, the utilization of blanks (a control used to verify the accuracy of analytical results) is recommended to determine if cross-contamination of sampling equipment has occurred. Samplers should also be programmed, set up, and supplied with a source of power. Properly charged batteries should be readily available for portable samplers in advance of a storm event and, as a backup power supply in case of power failure. Finally, although automatic samplers may be useful in some situations, several parameters are not amenable to collection by automatic sampler. These pollutants include fecal streptococcus, fecal coliforms, oil and grease and VOCs which should be collected manually, not automatically, as discussed in Section 3.1.2.

### 3.4 FLOW-WEIGHTED COMPOSITE SAMPLE COLLECTION

Composite samples are samples simply comprised of a series of individual sample aliquots that have been combined to reflect average pollutant concentrations of the storm water discharge during the

sampling period. Composite samples can be developed based on time or flow rate. There are four different types of composite samples, as follows:

- Constant Time - Constant Volume - Samples of equal volume are taken at equal increments of time and composited to make an average sample (similar to Exhibit 3-18). This method is not acceptable for samples taken for compliance with the storm water permit application regulations.
- Constant Time - Volume Proportional to Flow Increment - Samples are taken at equal increments of time and are composited proportional to the volume of flow since the last sample was taken (see Exhibit 3-19).
- Constant Time - Volume Proportional to Flow Rate - Samples are taken at equal increments of time and are composited proportional to the flow rate at the time each sample was taken (see Exhibit 3-20).
- Constant Volume - Time Proportional to Flow Volume Increment - Samples of equal volume are taken at equal increments of flow volume and composited (see Exhibit 3-21).

Generally, flow-weighted composite samples must be collected for most parameters. The methods for generating flow-weighted composite samples are discussed in the following sections.

For storm water discharge permit applications, the aliquots for flow-weighted composite samples must be collected during a representative storm for the first 3 hours, or for the duration of the storm event if it is less than 3 hours long. The storm water application regulations allow for flow-weighted composite samples to be collected manually or automatically. For both methods, equal volume aliquots may be collected at the time of sampling and then flow-proportioned and composited in the laboratory, or the aliquot may be collected based on the flow rate at the time of sample collection and composited in the field. When composite samples are collected, the regulations require that each aliquot collection be separated by a minimum of 15 minutes and that a minimum of three sample aliquots be taken within each hour of the discharge. See Exhibit 3-22 for an example of how this requirement may be fulfilled.

The provisions set forth in 40 CFR 122.21(g)(7) for collecting flow-weighted composite samples establish specific requirements for minimum time duration between sample aliquots. Where these conditions cannot be met, the permitting authority may allow alternate protocols with respect to the time duration between sample aliquots (see Chapter 5). However, permission from the permitting

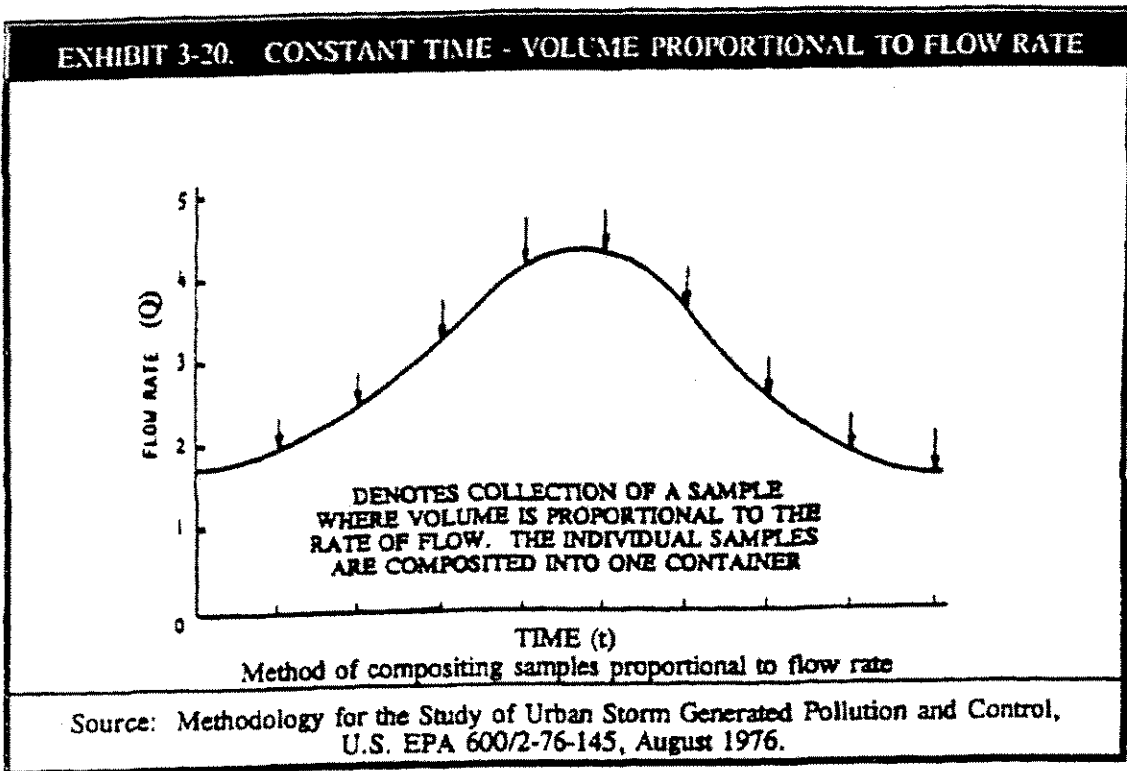

EXHIBIT 3-22. EXAMPLE OF SAMPLING INTERVALS

Suppose that a storm water discharge began at 2:15 p.m. and lasted until 5:15 p.m. on a Friday. The field staff person wants to collect the samples at regular intervals, so s/he plans to collect an aliquot with a volume that is proportional to the flow every 20 minutes. After the third hour of collection, the field staff person must deliver the samples to the laboratory (which is 10 minutes away). The laboratory closes at 5:00 p.m. So, s/he should take the last sample at 4:45 p.m. One way of doing this would be to collect samples (in hour three) at 4:15, 4:30, and 4:45 p.m. This would comply with the three-sample minimum in hour three (4:15-5:15 p.m.) and the required 15-minute minimum interval between collections. It would also allow the field staff person to get the samples to the lab before it closes for the weekend. On the other hand, if s/he missed the sample collection at 4:15 p.m. and instead, collected the sample at 4:20 p.m., then s/he would have to collect the next sample at 4:35 p.m. and the last sample at 4:50 p.m., and the field staff person would not be able to deliver the sample until Monday (by which time the required maximum holding time would be exceeded), and the sampling would need to be repeated.

authority must be obtained before changes are initiated. Considerations applicable to the collection of flow-weighted composites by automatic and manual techniques are discussed in the following sections.

### 3.4.1 HOW TO MANUALLY COLLECT FLOW-WEIGHTED COMPOSITE SAMPLES

Manually collected, flow-weighted composite samples may be appropriate for a facility that prefers not to invest in automatic equipment. This technique is cost-effective for short-term monitoring programs and for facilities where few outfalls are being sampled. The fundamental requirement for facilities that use these methodologies is that they should have personnel available to perform the sampling when needed. Those facilities where VOCs analysis of storm water discharges are required should manually collect composite samples since these parameters may not be amenable to sampling by automatic samplers. Compositing of VOC samples should be conducted in the laboratory as discussed in Section 3.5.2.

The manual collection of a flow-weighted sample is performed in the same manner as taking manual grab samples (see Section 3.3.1). The only difference is that a series of samples (or aliquots) will be collected. As discussed in the previous section, there are two ways to manually collect and combine the aliquots for a flow-weighted sample:

- Collect sample aliquot volumes based on the flow at the time of sampling which can immediately be combined to make the composite sample in the field (see Exhibit 3-23)
- Collect equal volume sample aliquots at the time of sampling and then flow-proportion and composite the aliquots in the laboratory (see Exhibit 3-24).

When uniform time intervals are used between the collection of the sample aliquots, the volumes of each aliquot used in the composite sample can be determined based on either volumes of flow or the flow rate, as they will result in similar proportions. However, when there are different time intervals between the sample aliquots, the individual sample aliquot volumes should be based on the runoff volume (calculated from the individual flow rates and durations) associated with each sample aliquot.

Generally, 1,000 ml for each aliquot collected should provide enough sample volume, when composited, for pollutant analyses of the required parameters contained in Section VII.A of Form 2F (see Section 3.6). More aliquot volume may be required if sampling is conducted for additional parameters. The laboratory conducting the analyses should always be contacted prior to a sampling event to determine how much sample volume they will require.

**EXHIBIT 3-23 EXAMPLE OF HOW TO COLLECT SAMPLE ALIQUOT VOLUMES BASED ON FLOW, AND PROPORTION AND COMPOSITE IN THE FIELD**

**Step 1:** Determine the necessary volume for compositing purposes.

**Example:** To fulfill analyses for all parameters in Section VII.A of Form 2F for which composite samples are required [Biochemical Oxygen Demand (BOD<sub>5</sub>), Chemical Oxygen Demand (COD), Total Suspended Solids (TSS), Total Kjeldahl Nitrogen (TKN), nitrate plus nitrite, and phosphorous] a total composite sample volume of 5,000 ml is needed by the contract laboratory.

**Step 2:** Determine an appropriate interval for collection of samples.

**Example:** Manually collected flow-weighted composite samples must consist of at least three sample aliquots collected per hour and must be gathered at least 15 minutes apart. For this example, sample aliquots will be collected exactly 20 minutes apart.

**Step 3:** Estimate or measure the volume of discharge for each sampling event.

**Example:** A discharge flow volume of 4.8 cubic feet will be used here.

**Step 4:** Convert the discharge flow volume to liters.

**Example:** To convert cubic feet to liters, use the conversion factor of 28.32 liters per 1 cubic foot as set forth in the following formula:

$$\text{Volume (liters)} = \text{Volume (cubic feet)} \times \frac{28.32 \text{ liters}}{1 \text{ cubic foot}}$$

$$\text{Volume} = 4.8 \text{ cubic feet} \times \frac{28.32 \text{ liters}}{1 \text{ cubic foot}} = 136 \text{ liters}$$

**Step 5:** Using Steps 3 and 4, volumes that have been discharged between the collection of each aliquot can be calculated.

(Note that the discharge volumes provided for aliquot numbers 2-9 have already been given for the purposes of this exhibit.)

**Example:** The procedures set forth in Section 3.2 may be used to calculate discharge volumes. The following table presents aliquot numbers, time of aliquot collection, and discharge volumes.

Aliquot Number	Time of Aliquot Collection	Discharged Volume
1	2:15 p.m.	136 liters
2	2:35 p.m.	200 liters
3	2:55 p.m.	122 liters
4	3:15 p.m.	178 liters
5	3:35 p.m.	156 liters
6	3:55 p.m.	117 liters
7	4:15 p.m.	94 liters
8	4:30 p.m.	21 liters
9	4:45 p.m.	12 liters

**EXHIBIT 3-23. EXAMPLE OF HOW TO COLLECT SAMPLE ALIQUOT VOLUMES BASED ON FLOW, AND PROPORTION AND COMPOSITE IN THE FIELD (Continued)**

- Step 6:** Determine the appropriate minimum aliquot volume as the basis for collecting other aliquot samples which together will provide adequate volume to fulfill the analytic requirements.  
 Example: In Step 1, it was determined that at least 5,000 ml of sample were required for flow-weighted composite sample analytical testing. As discussed in Section 3.4.1, basing the sample collection on a minimum aliquot volume of 1,000 ml gathered every interval (i.e., every 15 minutes) should result in adequate sample volume.
- Step 7:** Calculate the volume of the sample aliquot which must be collected during each aliquot sample period using the following formula:

$$\text{Aliquot volume (ml)} = \text{Minimum aliquot volume (ml)} \times \frac{\text{Aliquot's discharge volume (liters)}}{\text{Initial discharge volume (liters)}}$$

Step 6 shows that the minimum aliquot volume is 1,000 ml.

$$\text{Aliquot \#1 volume (ml)} = 1,000 \text{ ml} \times \frac{136 \text{ liters}}{136 \text{ liters}} = 1,000 \text{ ml}$$

$$\text{Aliquot \#2 volume (ml)} = 1,000 \text{ ml} \times \frac{200 \text{ liters}}{136 \text{ liters}} = 1,471 \text{ ml}$$

$$\text{Aliquot \#3 volume (ml)} = 1,000 \text{ ml} \times \frac{122 \text{ liters}}{136 \text{ liters}} = 897 \text{ ml}$$

$$\text{Aliquot \#4 volume (ml)} = 1,000 \text{ ml} \times \frac{178 \text{ liters}}{136 \text{ liters}} = 1,309 \text{ ml}$$

$$\text{Aliquot \#5 volume (ml)} = 1,000 \text{ ml} \times \frac{156 \text{ liters}}{136 \text{ liters}} = 1,147 \text{ ml}$$

$$\text{Aliquot \#6 volume (ml)} = 1,000 \text{ ml} \times \frac{117 \text{ liters}}{136 \text{ liters}} = 860 \text{ ml}$$

$$\text{Aliquot \#7 volume (ml)} = 1,000 \text{ ml} \times \frac{94 \text{ liters}}{136 \text{ liters}} = 691 \text{ ml}$$

$$\text{Aliquot \#8 volume (ml)} = 1,000 \text{ ml} \times \frac{21 \text{ liters}}{136 \text{ liters}} = 154 \text{ ml}$$

$$\text{Aliquot \#9 volume (ml)} = 1,000 \text{ ml} \times \frac{12 \text{ liters}}{136 \text{ liters}} = 88 \text{ ml}$$

A table of these calculations follows:

Aliquot Number	Discharged Volume	Aliquot Volume
1	136 liters	1,000 ml
2	200 liters	1,471 ml
3	122 liters	897 ml
4	178 liters	1,309 ml
5	156 liters	1,147 ml
6	117 liters	860 ml
7	94 liters	691 ml
8	21 liters	154 ml
9	12 liters	88 ml

In conclusion, a combination of the above sample aliquots result in a composite of 7,617 ml.

**EXHIBIT 3-24. EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW-PROPORTIONED AND COMPOSITED IN THE LABORATORY**

**Step 1: Determine the necessary volume for compositing purposes.**

*Example:* To fulfill analyses for all parameters in Section VII.A of Form 2F for which composite samples are required (BOD<sub>5</sub>, COD, TSS, TKN, nitrate plus nitrite, and phosphorous) a total composite sample volume of 5,000 ml is needed by the contract laboratory.

**Step 2: Determine an appropriate interval for collection of samples.**

*Example:* Manually collected flow-weighted composite samples must consist of at least nine sample aliquots and must be gathered at least 15 minutes apart; only three or four samples per hour may be taken. For convenience, the minimum number of three is chosen. Sample aliquots will be collected every 20 minutes.

**Step 3: Determine the aliquot which should be taken during each sampling event.**

*Example:* At least 5,000 ml of sample is required for flow-weighted composite sample analytical testing. As discussed in Section 3.4.1, a minimum aliquot volume of 1,000 ml gathered every interval (i.e., every 15 minutes) should result in adequate sample volume to be used for later flow-weighted compositing.

**Step 4: Estimate or measure the volume of discharge for each sampling event while collecting a discrete 1,000-ml aliquot, as discussed in Step 3, for later compositing.**

*Example:* Section 3.2 discusses methods to calculate total discharge volumes. A discharge flow volume of 4.8 cubic feet will be used here.

**Step 5: Convert the discharge flow volume to liters.**

*Example:* To convert cubic feet to liters, use the conversion factor of 28.32 liters per 1 cubic foot as set forth in the following formula:

$$\text{Volume (liters)} = \text{Volume (cubic feet)} \times \frac{28.32 \text{ liters}}{1 \text{ cubic foot}}$$

$$\text{Volume} = 4.8 \text{ cubic feet} \times \frac{28.32 \text{ liters}}{1 \text{ cubic foot}} = 136 \text{ liters}$$

**EXHIBIT 3-24. EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW-PROPORTIONED AND COMPOSITED IN THE LABORATORY (Continued)**

Step 6: Using Steps 3 and 4, calculate the volumes that have been discharged between the collection of each aliquot.

Example: The procedures set forth in Section 3.2 may be used to calculate discharge volumes. The following table presents aliquot numbers, time of aliquot collection, and discharge volumes (note that the discharge volumes provided for aliquot numbers 2-9 were chosen for purposes of this exhibit).

Aliquot Number	Time of Aliquot Collection	Discharged Volume
1	2:15 p.m.	136 liters
2	2:35 p.m.	200 liters
3	2:55 p.m.	122 liters
4	3:15 p.m.	178 liters
5	3:35 p.m.	156 liters
6	3:55 p.m.	117 liters
7	4:15 p.m.	94 liters
8	4:30 p.m.	21 liters
9	4:45 p.m.	12 liters

Step 7: Determine the aliquot sample which is associated with the greatest discharge volume.

Example: Aliquot number 2 was taken when the volume was 200 liters. This is the largest discharge volume.

Step 8: Calculate the volume of sample aliquot which must be used subsequent to the sample event to comprise a flow-weighted composite sample. The following formula should be used:

$$\text{Aliquot volume (ml)} = \frac{\text{Minimum aliquot volume (ml)} \times \text{Aliquot's discharge volume (liters)}}{\text{Largest discharge volume (liters)}}$$

Step 3 shows that the minimum aliquot volume is 1,000 ml. Using this value and the data determined as part of Steps 6 and 7, the following can be calculated:

$$\text{Aliquot \#1 volume (ml)} = 1,000 \text{ ml} \times \frac{136 \text{ liters}}{200 \text{ liters}} = 680 \text{ ml}$$

$$\text{Aliquot \#2 volume (ml)} = 1,000 \text{ ml} \times \frac{200 \text{ liters}}{200 \text{ liters}} = 1,000 \text{ ml}$$

$$\text{Aliquot \#3 volume (ml)} = 1,000 \text{ ml} \times \frac{122 \text{ liters}}{200 \text{ liters}} = 610 \text{ ml}$$

$$\text{Aliquot \#4 volume (ml)} = 1,000 \text{ ml} \times \frac{178 \text{ liters}}{200 \text{ liters}} = 890 \text{ ml}$$

$$\text{Aliquot \#5 volume (ml)} = 1,000 \text{ ml} \times \frac{156 \text{ liters}}{200 \text{ liters}} = 780 \text{ ml}$$

$$\text{Aliquot \#6 volume (ml)} = 1,000 \text{ ml} \times \frac{117 \text{ liters}}{200 \text{ liters}} = 585 \text{ ml}$$

**EXHIBIT 3-24. EXAMPLE OF HOW TO MANUALLY COLLECT EQUAL SAMPLE ALIQUOTS WHICH ARE LATER FLOW-PROPORTIONED AND COMPOSITED IN THE LABORATORY (Continued)**

$$\text{Aliquot \#7 volume (ml)} = 1,000 \text{ ml} \times \frac{94 \text{ liters}}{200 \text{ liters}} = 470 \text{ ml}$$

$$\text{Aliquot \#8 volume (ml)} = 1,000 \text{ ml} \times \frac{21 \text{ liters}}{200 \text{ liters}} = 105 \text{ ml}$$

$$\text{Aliquot \#9 volume (ml)} = 1,000 \text{ ml} \times \frac{12 \text{ liters}}{200 \text{ liters}} = 60 \text{ ml}$$

A table of these calculations follows

Aliquot Number	Discharged Volume	Aliquot Volume
1	136 liters	680 ml
2	200 liters	1,000 ml
3	122 liters	610 ml
4	178 liters	890 ml
5	156 liters	780 ml
6	117 liters	585 ml
7	94 liters	470 ml
8	21 liters	105 ml
9	12 liters	60 ml

In conclusion, a combination of the above sample aliquots results in a composite sample of 5,100 ml.

Manually collected flow-weighted composite samples can also be prepared by collecting sample aliquots of equal volume where the collection times are related to the volume of discharge which has passed since the last sample aliquot collection. However, this method is subject to fluctuating flow rates and volumes which may dictate that samples be taken prior to the 15-minute interval required by the regulations. In that case, the alternative sampling protocol would have to be approved by the permitting authority.

**3.4.2 HOW TO COLLECT FLOW-WEIGHTED COMPOSITE SAMPLES BY AUTOMATIC SAMPLER**

The typical automatic sampler collects sample aliquots after a specific interval. These aliquots can be flow-weight composited by the automatic sampler; or by hand in the laboratory. The automatic

sampler may be programmed in one of three ways: (1) to collect a sample at equal time intervals and varying aliquot volumes commensurate with the flow (either rate or volume) that has passed; (2) to collect equal volume aliquots at varying time intervals commensurate with the flow volume that has passed; or (3) to collect equal volume aliquots of sample at equal time intervals.

The first two methods automatically composite the sample but require that the sampler be connected to a flow meter such that the sampler determines either the flow rate or the amount of volume that passes. Since these methods automatically composite samples, one main sample container may be used to receive all aliquots. The third method automatically collects the sample aliquots but does not automatically flow-weight composite the sample. As such, discrete sample containers must be used, and manual flow-weighted compositing must be conducted after the aliquots are collected. Exhibits 3-23 and 3-24 in Section 3.4.1 describe the manual compositing procedures that should be followed.

Manufacturers' instructions for the use of an automatic sampler provide the best explanation of programming options and should be consulted for information on programming samplers for storm water collection. Some of the points regarding automatic samplers discussed in Section 3.3.2 should also be considered.

### 3.5 SAMPLE HANDLING AND PRESERVATION

Samples must be handled and preserved in accordance with 40 CFR Part 136. This section describes acceptable analytical methods, including requirements regarding sample holding times, containers, sizes, and preservation requirements. For each pollutant or parameter that may have to be analyzed, 40 CFR Part 136 includes information on:

- Container types to be used to store the samples after collection
- Procedures to correctly preserve the samples
- The maximum holding time allowed for each parameter.

The following sections present a detailed discussion of preservation techniques and sample handling procedures. Technical Appendix C presents a matrix of required containers, preservation techniques,

and holding times for each parameter. Most laboratories can provide clean sample containers, preservatives, sealing, chain-of-custody forms and can advise further on sample handling and preservation.

### 3.5.1 DECONTAMINATION OF SAMPLE EQUIPMENT CONTAINERS

Storm water sample containers should be cleaned and prepared for field use according to the procedures set forth in 40 CFR Part 136. A summary of the procedures is presented below for plastic containers, any or all of which may be performed by the laboratory or container distributor:

- Nonphosphate detergent and tap water wash
- Tap water rinse
- 10 percent nitric acid rinse (only if the sample is to be analyzed for metals)
- Distilled/deionized water rinse
- Total air dry.

To clean glass containers, the same steps should be taken; but, after the distilled/deionized water rinse, the containers should be rinsed with solvent if appropriate prior to total air drying. After the decontamination procedures have been accomplished, the sample containers should be capped or sealed with foil, and the sampling device should be protected and kept clean. It is a good idea to label sample containers after cleaning. The laboratory should keep a record of the technician performing the cleaning procedure as well as the date and time. This begins the required chain-of-custody procedure for legal custody (see Section 3.10 for more information). A chain-of-custody record accompanies each sample to track all personnel handling the sample. This record is essential to trace the sample integrity in the event that quality control checks reveal problems. For this reason, as well as to avoid problems if contamination issues arise, it is suggested that the laboratory performing the analysis perform the cleaning.

### REVIEW OF TECHNICAL WORKPLAN FOR SANTA SUSANA FIELD LABORATORY, CANOGA PARK – EVALUATION FILTERED VERSUS NONFILTERED SAMPLES FOR RADIONUCLIDES AND EVALUATION OF GRAB VERSUS TIME-WEIGHTED AVERAGE SAMPLES

Dear Mr. Lafflam:

On August 31, 2004, Boeing submitted a workplan for the evaluation of filtered versus unfiltered samples for radionuclides and the evaluation of grab versus time-weighted average samples for the storm water samples. Regional Board staff has completed the review of the workplan and wishes to submit the following comments. The purpose of the composite versus grab sample for storm water discharges from the Perimeter Pond is to determine if the concentrations of priority pollutants in the grab sample are comparable to those detected in the time-weighted average samples collected during the same rain event from the same sample location. The purpose of the radiological filtered versus unfiltered study is to look at the potential effects on the detected concentrations of radiological components by filtering the sample.

The workplan describes the protocols for the two projects in two separate studies. Study One addresses the grab versus time-weighted average sample protocols. The Regional Board has no comments on the Study One protocol described in the Workplan. The sampling procedure, as outlined, sufficiently addresses the targeted issues.

Study Two addresses the radiological components measured in filtered versus unfiltered wastewater, and Regional Board staff has several comments on the Study Two protocol. The purpose of the study is to determine if the analyses, as currently executed, provide data to determine if radiological components are being transported from the facility in storm water runoff. The historical activities at the site have resulted in some radiological contamination. The primary mechanism for that contamination to be transported offsite is to be dissolved in water. Cesium 137 is the radionuclide with the highest possibility of being present onsite, and the targeted radionuclides (Gross Alpha, Gross Beta, Radium-226 and Radium-228, Tritium and Strontium) have historically been used as indicator species to determine if it is being transported offsite.

January 12, 2005

Previously, most of the surface water samples analyzed were filtered prior to analysis. This is a minor deviation from the protocol outlined in USEPA Method 900.0, which is used when analyzing samples for Gross Alpha and Gross Beta. The method requires that samples containing 100 mg of dissolved solids or a solids density thickness of 5 mg/cm<sup>2</sup> would be the maximum concentrations of solids for that sample, when the sample is evaporated and counted for gross alpha. The method is designed for drinking water that has been through treatment and possibly filtration, and which routinely has low solids and turbidity. Since the method is being used at Santa Susana Field Laboratory as a screening tool for surface water runoff, which will likely have higher levels of suspended solids than drinking water, Boeing has been filtering samples prior to analyses.

The workplan was developed, in an effort to determine the effect of filtering the sample on the resultant concentration and hence the decision regarding whether Cesium 137 (targeted as an indication of contamination) is being transported offsite via surface water runoff. An unfiltered and a filtered sample will be analyzed for each sampling event evaluated.

Unfiltered samples require expedited analysis in the laboratory. They must be submitted in glass containers within twenty-four hours of sample collection. The samples are to be shaken well prior to analysis. Acidification of the unfiltered samples will ultimately drive constituents into solution that, under normal atmospheric conditions, would not be in solution. The acidification of the turbid water will change the detected concentrations of radiologicals in the sample. Hence, the unfiltered samples should not be acidified. Samples that will represent those being "filtered" should be filtered prior to acidification.

The filters used to filter the sample should be weighed and tared prior to filtration. The filter with the substrate is to subsequently be analyzed using Gamma Spectroscopy. Gamma Spectroscopy will be used to determine the concentration of Cesium 137 present in the particulates collected on the filter. The quantity of sample analyzed should enable analysis to detect Cesium 137 at local background levels, if possible.

If you have any further question, please contact Cassandra Owens at (213) 576-6750.

### UPDATE TO PROTOCOL FOR SANTA SUSANA FIELD LABORATORY, CANOGA PARK - EVALUATION FILTERED VERSUS NONFILTERED SAMPLES FOR RADIONUCLIDES

Dear Mr. Lafflam:

On January 12, 2005, the Regional Board submitted our review of the proposed "Workplan for Santa Susana Field Laboratory, Canoga Park - Evaluation Filtered Versus Nonfiltered Samples For Radionuclides and Evaluation of Grab versus Time-weighted Average Samples." Since that time, the Regional Board has been researching protocols and conferring with knowledgeable agencies concerning the study and the information that it will provide. This letter further clarifies the analyses required.

The requirements stipulated previously were that a filtered and unfiltered sample would be analyzed for each of ten (10) sampling events. Each sample, both filtered and unfiltered, is to be analyzed for Gross Alpha, Gross Beta, combined Radium 226 and Radium 228 and Tritium. If the results from the Combined Radium-226 and 228 analyses exceed the stipulated effluent limits for either of the constituents, the sample must be analyzed for Strontium-90. All samples are to be analyzed for Tritium.

As stated in the January 12, 2005 letter, unfiltered samples require expedited analysis in the laboratory. They must be submitted in glass containers within twenty-four hours of sample collection. The samples are to be shaken well prior to analysis. Acidification of unfiltered samples will ultimately drive constituents into solution that, under normal atmospheric conditions, would not be in solution. The acidification of the turbid water will change the detected concentrations of radionuclides in the sample. Therefore, the unfiltered samples should not be acidified. Samples that will represent those being "filtered" should be filtered prior to acidification by the laboratory performing the analyses. No field filtering of samples is permitted.

The filters used to filter the sample should be weighed and tared prior to filtration. The filter with the residue is to subsequently be analyzed using Gamma Spectroscopy. Gamma Spectroscopy will be used to determine the concentration of Cesium 137 present in the particulates collected on the filter. The quantity of sample analyzed should enable analysis to detect Cesium 137 at local background levels, if possible.

*California Environmental Protection Agency*

*Our mission is to preserve and enhance the quality of California's water resources for the benefit of present and future generations.*

Mr. Steve Lafflam  
The Boeing Company

- 2 -

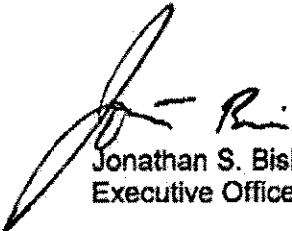

March 22, 2005

When reporting the results for the filtered samples, the filtrate and residue results are to be tabulated separately, and then tabulated as a sum. The detected concentration in the filtrate is to be compared to the Maximum Contaminant Level for each of the radionuclides. The radionuclide concentration detected of the residue collected on the filter should be compared to the USEPA Preliminary Remediation Goals (PRGs) for that radionuclide. The results for each sampling event should be included in your regular quarterly monitoring report. Within 45 days after the last parallel study sampling has been obtained, a report detailing the results must be submitted to the Regional Board.

During each sampling event a sample is to be analyzed for Tritium. The Tritium sample requires special handling. It should be collected in a glass container only. The sample should not be filtered or acidified and it must be submitted to the laboratory within twenty-four hours of sample collection.

If you have any further question, please contact Cassandra Owens at (213) 576-6750.

Sincerely,

Jonathan S. Bishop

Subject: Submission of Revised Technical Workplan Pursuant to Section 13267 of the California Water Code Boeing Company, Santa Susana Field Laboratory Canoga Park, California (NPDES Permit No. CA0001309)

Dear Ms. Owens:

The Boeing Company (Boeing) is submitting a Revised Technical Workplan pursuant to Section 13267 of the California Water Code and as requested by the California Regional Water Quality Control Board, Los Angeles Region (RWQCB) in a letter dated May 20, 2004. The revisions contained herein have been incorporated as requested in the Board's January 12, 2005 review of the original Workplan and the subsequent March 22<sup>nd</sup>, 2005 update. As such, this revised Technical Workplan describes the protocol for additional sampling and analyses activities at the Santa Susana Field Laboratory (SSFL). This required sampling is in conjunction with current National Pollutant Discharge Elimination System (NPDES) sampling conducted at the SSFL as required under permit number CA0001309.

If there are any questions pertaining to this Workplan, please contact Bill McIlvaine at (818) 586-9228.

Sincerely,

A handwritten signature in black ink, appearing to read "Paul J. Costa", with a horizontal line extending to the right.

**The Boeing Company  
Rocketdyne Propulsion & Power**

**Technical Workplan to Investigate Surface Water Run-off Leaving the Santa Susana Field  
Laboratory**

**Overview of the Technical Study Requirements**

On May 20, 2004 The Boeing Company received a letter from the Los Angeles Regional Water Quality Control Board (Board) requiring Boeing to conduct a special study of surface water runoff at the Santa Susana Field Laboratory. This study was required pursuant to Section 13267 of the California Water Code and its intent is to provide information to the Board regarding the quality of water leaving SSFL during rain events and dry weather discharges. Specifically this letter required Boeing to conduct two special studies. The first is to compare the results of grab sampling versus flow weighted composite sampling of surface water run-off. The second is to compare the results of radiological samples that have been filtered and unfiltered prior to analysis. Boeing submitted a technical workplan (workplan) on August 31, 2004 that outlined the details of these two studies. A review of the workplan was received on January 21, 2005 and a subsequent workplan review update was received on March 24, 2005. The following revised workplan is intended to incorporate the requested changes and to meet the aforementioned requirements. The revised plan will become effective once it has been approved by Board staff.

**Study 1. Composite versus Grab Sampling**

Overview of Study:

The Board requires this study to consist of six sampling events at Perimeter Pond (Outfall 011). Three are to occur during wet weather discharges and three during dry weather discharges. Each sampling event is to include collecting a grab sample during the first 30 minutes of discharge and a flow-weighted composite sample that is to be collected over the course of the first three hours of flow or for the duration of the discharge if less than three hours. The constituents to be analyzed have been specified in the Board letter and are included in Table 1 of this workplan.

General Sampling Protocols:

Wet weather sample collection will commence at Perimeter Pond (Outfall 011) upon the first storm event that produces sufficient flow for complete analyses. Wet weather sample collection will continue for the two subsequent rain events that produce sufficient flow. The sample collection point will be located at the weir immediately downstream from Perimeter Pond and be will representative of all surface water that comes from the eastern portion of the Santa Susana Field Lab including that which flows through Perimeter Pond. Sampling will continue through the dry season(s) until three additional samples of dry weather discharge have been collected. It should be noted that as referenced on page 5 of the Fact Sheet for NPDES Permit No. CA0001309, water may be transferred from Perimeter Pond to the R-1 Pond and then up to the Skyline Tank Farm for reuse as engine test cooling water or released to Silverdale Pond as

needed. This water management program along with the reduced introduction of water from ongoing activities will reduce the frequency of both wet and dry weather discharges from this sampling location. It is therefore possible that meeting the sampling requirements for this portion of the study may take several years. It should also be noted that prior to sampling, an evaluation will take place to identify potential safety issues. Such factors considered would include the amount of ambient light, road conditions, and potential for flash flooding. Samples may not be collected within the prescribed time if it has been determined that doing so may jeopardize the safety of field personnel. In such cases, sample collection will begin as soon as it is safe to do so. If such a delay occurs, an explanation as to the reason for the delay will be noted in the technical report submission.

#### Grab Sampling Methodology:

Field personnel will collect the grab samples following methodologies outlined in Chapter 3 of the EPA's July 1992 NPDES Storm Water Sampling Guidance Document (Guidance Document). An excerpt of this document has been enclosed for your review. Samples will be stored in appropriate bottles under prescribed temperature conditions following EPA methodologies. An outside courier will transport the samples to a State Certified Analytical Laboratory for analysis using standard chain of custody forms to document proper handling.

#### Composite Sampling Methodology:

Flow weighted samples will be collected from the same location at Perimeter Pond as the grab samples. For this portion of the study, samples will be collected either manually or by utilizing an automatic sampler that is capable of refrigerating the samples until collected by field personnel. For consistency in comparing grab sample results with flow weighted composite sample results, the grab sample noted above will be collected at approximately the same time the first aliquot for the composite sample is taken. Composite samples will also be collected and stored according to methodologies outlined in the Guidance Document. Sampling will take place over a three hour period or for the duration of the flow event whichever is shorter. During this time and also in accordance with the Guidance Document, three equal aliquots of sample will be collected per hour at equal time intervals. Aliquot volumes will be sufficient to complete analyses of all required parameters. It is expected that each aliquot will contain approximately 2 gallons of liquid that will be used for flow proportioning.

The amount of sample from each aliquot that will be used to make up the composite sample will be either calculated using the formula expressed in Exhibit 3-23 and 3-24 of the Guidance Document, as applicable, or calculated based on the proportion of flow during each sampling interval to the total flow during the sampling event. Flow data from an ISCO model 4210 Ultrasonic flow meter which has been installed at the sample point will be used for determination of aliquot amount. The flow meter was calibrated in July 2004 to assure accurate measurements, and will be re-calibrated on an annual basis. The formation of the composited sample using the individual aliquots and flow data will either be performed in the field or at the laboratory depending upon environmental conditions. A courier will transport the resultant samples to a

State Certified Analytical Laboratory for analysis using standard chain of custody forms to document proper handling.

The automatic sampler will only be used for those analyses amenable to such collection techniques as noted in exhibit 3-23 of the Guidance Document. For analytes that are not amenable to collection by automatic samplers, (i.e.: VOCs) samples will be manually collected by field personnel using proper collection containers at equal intervals and will be stored per requirements for compositing either in the field or at the laboratory per Guidance Document specifications.

## **Study 2. Sampling for Radiological Components**

### Overview of Study

This second study requires the collection and analysis of ten samples for Gross Alpha, Gross Beta, combined Radium 226 & Radium 228 (if analytical results require it), Tritium, and Strontium-90. Each sample is to be split into two halves, with one portion being filtered and analyzed while the other portion is left unfiltered prior to analysis. Sampling is to be conducted using the specified EPA radiological methodologies as directed by the Board and is included in Table 1.

### Sampling Methodology:

Data for this study will include results from a total of ten sampling events. A minimum of four of the samples will be taken from the RMHF facility (Outfall 003). The other six samples will be the same samples from the first study conducted at Perimeter Pond. All will be grab samples collected in glass containers during the first hour of discharge or at the first safe opportunity. Any delays in sampling will be detailed in the final report. Samples will be expedited such that they will be received by a State Certified Analytical Laboratory within twenty-four hours of collection. Each grab sample will be shaken well then split into two equal aliquots. One aliquot will be analyzed unfiltered. As per Board direction, the unfiltered sample will not be acidified prior to analysis. The second aliquot will be filtered at the Laboratory prior to acidification and analysis. A .45 micron filter will be weighed and tarred prior to filtration. The filtered aliquot may then be acidified if indicated by the EPA method. Both the filtered and unfiltered samples will be analyzed following the EPA protocols indicated below. The filter and substrate from the filtered sample will subsequently analyzed for Cesium 137 using Gamma Spectroscopy.

Each resultant sample including the filtrate will be analyzed for the following:

- Gross Alpha (using EPA Method 900.0)
- Gross Beta (using EPA Method 900.0)
- Radium-226 (using EPA Method 903.0 or 903.1 if required)
- Radium-228 (using EPA Method 904.0 if required)
- Tritium (using EPA Method 906)
- Strontium-90 (using EPA Method 905.0)

It should be noted that the EPA Method 900.0 for Gross Alpha is designed for water with low suspended solids and turbidity. Samples with more than 100 mg/l of solids or greater than 5.0

NTU turbidity will likely raise the detection limits due to the limitations of the method. The detection limit for each sample will be included in the report.

#### **Reporting of Results**

Since these analyses are being performed on samples taken from locations regulated under NPDES Permit No. CA0001309, sampling results will be submitted in Boeing's quarterly Self Monitoring Report (SMR). Sample results from modified procedures (flow weighted, filtered, and unfiltered unpreserved samples) will be summarized in a special section that will be submitted along with the quarterly SMR. In the event there was insufficient flow to support this study in the reporting quarter, a notation will be made in the report. Boeing assumes that those samples undergoing analyses required in the NPDES permit will be subject to permit requirements including the 24-hour notification required under Section III. A. of the WDRs in the existing NPDES permit (CA0001309). Boeing also assumes that those samples which deviate from normal sampling methodologies as specified in the NPDES permit would not be used for compliance determination. This would include the flow weighted composite samples, the filtered samples and the unfiltered samples that were not acidified.

Upon completion of all required sampling and analysis, a Final Technical Report will be prepared and submitted to the RWQCB. The Technical Report will include a summary of sampling activities, summary of analytical results, and supporting laboratory data sheets. ,

Notes:

- Total of 3 dry weather sampling events, when there is discharge flow from Perimeter Pond.
- Total of 3 wet weather sampling events, when there is discharge flow from Perimeter Pond: (1) First rain event; (2) Subsequent rain event; (3) Subsequent rain event.
- Total of 4 wet weather sampling events, when there is discharge flow from Outfall 003.

EPA - United States Environmental Protection Agency

FW - Flow-weighted sample

G - Grab sample

G\* - Grab sample will include analysis of filtered and unfiltered sample water, and analysis of sediment from filtered water

G\*\* - Sediment will be analyzed from filtered portion of grab sample

Note:

Total Combined Radium values were calculated specifically for this report following the procedures outlined in the text and below. Any of these data used for NPDES permit compliance purposes may have appeared different in previously reported documents. Neither method of calculation results in potential permit limit exceedances.

Irrespective of whether or not one or more radium-226 or radium-228 measured values are non-detect, the following rules were followed in calculating total combined radium (TCR) data.

**Measure Value (MV)**

$$MV_{Ra-226+Ra-228} = MV_{Ra-226} + MV_{Ra-228}$$

**Minimum Detectable Activity (MDA)**

$$MDA_{Ra-226+Ra-228} = MDA_{Ra-226} + MDA_{Ra-228}$$

**2-Sigma Error (2σ)**

$$2\sigma_{Ra-226+Ra-228} = 2 * ( (2\sigma_{Ra-226}/2)^2 + (2\sigma_{Ra-228}/2)^2 )^{0.5}$$

Total Combined Radium values were calculated specifically for this report following the procedures outlined in the text and below. Any of these data used for NPDES permit compliance purposes may have appeared different in previously reported documents. Neither method of calculation results in potential permit limit exceedances.

Irrespective of whether or not one or more radium-226 or radium-228 measured values are non-detect, the following rules were followed in calculating total combined radium (TCR) data.

**Measure Value (MV)**

$$MV_{Ra-226+Ra-228} = MV_{Ra-226} + MV_{Ra-228}$$

**Minimum Detectable Activity (MDA)**

$$MDA_{Ra-226+Ra-228} = MDA_{Ra-226} + MDA_{Ra-228}$$

**2-Sigma Error (2σ)**

$$2\sigma_{Ra-226+Ra-228} = 2 * ( (2\sigma_{Ra-226}/2)^2 + (2\sigma_{Ra-228}/2)^2 )^{0.5}$$

Attention: Bronwyn Kelly  
Project: 13267 (Study 2)  
Sampled: 01/04/05  
Del Mar Analytical Number: IOA0115

Dear Ms. Kelly:

Eberline Services performed the Gross Alpha and Gross Beta analysis by EPA 900.0, the Tritium analysis by EPA 906.0, and the Strontium-90 analysis by EPA 905.0 for the project referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	Eberline ID
Outfall 003 unfiltered	IOA0115-01	8149-001
Outfall 003 filtered	IOA0115-02	8149-002

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
DEL MAR ANALYTICAL

Michele Harper  
Project Manager

Eberline Services Report R501015-8149

Dear Ms. Harper:

Enclosed are results from the analyses of two water samples received at Eberline Services on January 6, 2005. The samples were analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## I. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0115, IOA0121, IOA0131  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 4  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: March 03, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. All samples were intact and in good condition.

According to the Eberline login sheet, none of the samples were received preserved. It was confirmed in correspondence with Eberline dated 01/31/05, that the gross alpha, gross beta, and strontium samples were not preserved upon receipt. According to the Los Angeles Water Quality Control Board (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. As the strontium aliquot for Outfall 003 Filtered was not preserved; the nondetect strontium result was qualified as estimated, "UJ." Additionally, according to the 01/12/05 LARWQCB guidance letter, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. As none of the tritium samples were submitted on glass containers, all nondetect tritium results were qualified as estimated, "UJ." No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. The original COCs for Outfall 003 did not request that an aliquot of each sample be filtered; however, the Del Mar project manager confirmed in a telephone conversation dated 1/31/05, that this was required by MWH. The original COC for Outfall 011 (SDG IOA0121) did not request that the sample containers received be analyzed for radionuclides. A memo from MWH personnel dated 2/17/05 requested these analyses. The transfer COCs accounted for all samples. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium and strontium samples were analyzed within 180 days of collection. The gross alpha and gross beta samples were analyzed beyond the five day holding time for unpreserved samples; therefore, the gross alpha and gross beta results were qualified as estimated, "J," for detects and, "UJ," for nondetects. No qualifications were necessary.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha

The initial calibration included with the data was performed in February 2003. All detector efficiencies were below 20%; therefore, the nondetected alpha results were qualified as estimated, "UJ," for nondetects and "J," for detects.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable.

### Gross Beta and Strontium-90

The initial calibrations were performed in June 1997. All detector efficiencies were at least 20% and were considered acceptable. All continuing calibration results were within the laboratory control limits; therefore, no qualifications were necessary.

## **2.3 BLANKS**

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

One blank spike (8147-002) was analyzed in association with the samples in these SDGs. All recoveries were within both 3-sigma limits and the laboratory control limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed a duplicate analysis on Outfall 011 Composite. The RPDs for gross beta, tritium, and strontium were  $\leq 20\%$ . The RPD for gross alpha was  $>20\%$ ; however, as the results were within the 3 sigma limit, no qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

The laboratory performed matrix spike analyses on Outfall 011 Composite for gross alpha, gross beta and tritium. The recoveries were within both 3-sigma limits and the laboratory control limits. No qualifications were necessary.

## **2.7 SAMPLE RESULT VERIFICATION**

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs:

Attention: Bronwyn Kelly  
Projects: 13267 (Study 2) / Routine Outfall 003  
Sampled: 2/11/05  
Del Mar Analytical Number: IOB1069

Dear Ms. Kelly:

Eberline Services performed the Gross Alpha/Beta (EPA 900.0), Tritium (EPA 906.0), Strontium-90 (EPA 905.0), Radium-226 (Ra-226, EPA 903.1), Radium-228 (Ra-228, EPA 904.0) and Cesium 137 by Gamma Spectroscopy (EPA 901.1) analyses for the projects referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	EBERLINE ID
Outfall 003 Filtered	IOB1069-01	R502139-01 / 8268-001
Outfall 003 Unfiltered	IOB1069-02	R502139-01 / 8268-002
Outfall 003 Substrate	IOB1069-03	R502140-01 / 8269-001

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
DEL MAR ANALYTICAL

  
Michele Harper

Eberline Services Report R502139-8268

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 15, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0); results for those analyses were reported on March 8. This report contains the analytical results for Ra-226 (EPA903.1) and Ra-228 (EPA904.0). The Ra-226 QC samples are 8368-005, 006, and 007, and the Ra-228 QC samples are 8263-002, 003, and 004. The QC LCS, blank analyses, and sample duplicates for both the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90 and Ra-228, do not require matrix spike analyses to be performed. Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

ACTION ITEMS <sup>a</sup>	
1. Case Narrative Deficiencies	
2. Out of Scope Analyses	
3. Analyses Not Conducted	
4. Missing Hardcopy Deliverables	
5. Incorrect Hardcopy Deliverables	
6. Deviations from Analysis Protocol, e.g.,	Qualifications applied for:
Holding Times	<u>1. Exceeded holding times.</u>
GC/MS Tune/Inst. Performance	<u>2. Matrix spike recovery outlier.</u>
Calibrations	<u>3. Laboratory duplicate RPD outlier.</u>
Blanks	<u>4. Incorrect sample container.</u>
Surrogates	<u>5. Detector efficiency outliers.</u>
Matrix Spike/Dup LCS	<u>6. Incorrect sample preservation.</u>
Field QC	<u>7. Reanalysis rejected in favor of original result</u>
Internal Standard Performance	<u>Three tritium results rejected due to incorrect sample preservation.</u>
Compound Identification and Quantitation	
System Performance	
COMMENTS <sup>b</sup>	

<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements.  
<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*#

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB0418, IOB0980, IOB0993, IOB0996, IOB0997,  
IOB1001, IOB1004, IOB1014, & IOB1069  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 11  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: March 23, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

Most samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . Eberline, the subcontract laboratory, did not provide sample receipt temperature information; however, as it is not necessary to chill radiological samples, no qualifications were required. All samples were received intact and in good condition.

According to the Eberline login sheet, Outfall 002 was received unpreserved. It was confirmed in correspondence with Eberline dated 01/31/05, that the gross alpha, gross beta, and strontium samples were not preserved upon receipt; therefore, the nondetected strontium result for Outfall 002 was qualified as estimated, "UJ." The gross alpha and gross beta results were not qualified for lack of preservation, as the method also specifies a five-day holding time for unpreserved samples.

Eberline noted on their login sheets that Outfall 007, Outfall 008, Outfall 009 and Outfall 010 were received preserved, in plastic containers. The method states that tritium samples should not be preserved. Per a telephone conversation with M. Mannion of Eberline, these samples were adjusted back to a pH of about 7 upon receipt at Eberline. Due to the improper pH adjustments, the tritium results for Outfall 007, Outfall 008, Outfall 009, and Outfall 010 were rejected, "R." Del Mar Analytical sent additional aliquots of Outfall 007, Outfall 008, Outfall 009, and Outfall 010 for tritium reanalyses. These samples were received in the proper containers and were not preserved.

Additionally, according to the Los Angeles Regional Water Quality Control Board's guidance letter dated 01/12/05, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. As the Outfall 007, Outfall 008, Outfall 009 and Outfall 010 tritium samples were previously rejected, no further qualifications were required.

After all analyses were complete, Del Mar Analytical sent extra volume of Outfall 001 to Eberline for gross alpha reanalysis and radium-228 and radium-226 analyses. These aliquots were received properly preserved. No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. Filtered, unfiltered, and substrate analyses were requested for Outfall 011 (IOB1014) on the original COC from the field to Del Mar. These instructions did not appear on the transfer COC to Eberline and subsequently only unfiltered analyses were performed. The remaining original and transfer COCs accounted for the samples and analyses presented in this data package. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. A gross alpha reanalysis was requested for Outfall 001, and tritium reanalyses were requested for Outfall 007, Outfall 008, Outfall 009, and Outfall 010. To distinguish between the original and reanalysis results, the reviewer added "RE1," suffices to the original MWH and Del Mar Analytical IDs. No qualifications were required.

### 2.1.3 Holding Times

The tritium, radium, and strontium samples were analyzed within 180 days of collection. The Outfall 002 and Outfall 003 Unfiltered gross alpha and gross beta samples were analyzed beyond the five day holding time for unpreserved samples; therefore, these gross alpha and gross beta results were qualified as estimated, "J," for detects and, "UJ," for nondetects. No further qualifications were necessary.

## 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha

The initial calibration included with the data was performed in February 2003. All detector efficiencies were below 20%; therefore, the gross alpha results were qualified as estimated, "UJ," for nondetects and, "J," for detects, unless otherwise rejected (see section 2.10).

### Gross Beta

The initial calibrations were performed in June 1997. All gross beta detector efficiencies were at least 20% and were considered acceptable.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1997. All strontium chemical yields were at least 65% and were considered acceptable and the strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Cesium

The reviewer confirmed that the 662 KeV peak was used for quantitation, with an efficiency of 85%. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in May 2004. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-228 and was verified in June 2003. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 90%. And the actinium chemical yields were greater than 65%. No qualifications were necessary.

### 2.3 BLANKS

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Six blank spikes (8261-002, 8237-002, 8269-002, 2008-002, 9479-004, 8377-002) were analyzed in association with the samples in these SDGs. The gross alpha, gross beta, and strontium recoveries for 8261-002 were outside of the 3-sigma limits, but all had acceptable recoveries of 80%, 88%, and 108%, respectively. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

### 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses for gross alpha, gross beta, tritium, and strontium on Outfall 002, Outfall 007, and Outfall 003 Substrate, and for tritium on Outfall 007 RE1. The gross alpha and tritium RPDs were greater than 20% for Outfall 007. The gross alpha results were within 3-sigma and were considered acceptable, but the tritium result was just above 3-sigma; however, as no associated tritium detects were retained (see section 2.1.1), no qualifications were required. The remaining RPD were  $\leq 20\%$ . No further qualifications were necessary.

### 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

The laboratory performed matrix spike analyses for gross alpha, gross beta, and tritium on Outfall 002 and Outfall 007 and for tritium on Outfall 007 RE1. The Outfall 002 recovery for gross alpha was below 3-sigma; therefore, the gross alpha results in all samples except Outfall 007 were qualified as estimated, "J," for detects and, "UJ," for nondetects. As Outfall 007 had an acceptable recovery for gross alpha, no qualifications were applied. The remaining recoveries were within the 3-sigma limits. No further qualifications were necessary.

### 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted.

The original planchet for gross alpha in Outfall 001 was recounted once per a request from MWH personnel. The recount yielded an equivalent result as the original count and was not reported. The sample was later reanalyzed from extra sample volume provided by Del Mar Analytical, and was reported as Outfall 001 RE1. As the two gross alpha results were similar, the reviewer rejected, "R," the reanalysis, Outfall 001 RE1, in favor of the original result, Outfall 001. No further qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

Outfall 003, February 18, 2005

Del Mar Analytical Laboratory Report

LABORATORY REPORT

Prepared For: MWH-Pasadena/Boeing  
300 North Lake Avenue, Suite 1200  
Pasadena, CA 91101  
Attention: Bronwyn Kelly

Project: Annual Outfall 003

Sampled: 02/18/05  
Received: 02/18/05  
Issued: 04/06/05 09:42

NELAP #01108CA California ELAP#1197 CSDLAC #10117

*The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain of Custody, 1 page, is included and is an integral part of this report.  
This entire report was reviewed and approved for release.*

### CORRECTIVE ACTION REPORT

Department: Extractions

Date: 02/28/2005

Method: EPA 625

Matrix: Water

QC Batch: 5B22043

**Identification and Definition of Problem:**

The percent recovery for benzidine in the BSD was below method acceptance limits.

**Determination of the Cause of the Problem:**

Benzidine is known to be a problematic compound. According to the EPA, it can be subject to oxidative losses during solvent extraction and its chromatographic behavior is poor.

**Corrective Action Taken:**

The percent recovery in the BS was within the acceptance limits. All results reported for benzidine are potentially biased low and can be considered estimates only.

Quality Assurance Approval:

Rima Angkasa

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of unknown quality.
- L2** Laboratory Control Sample recovery was below method control limits.
- M1** The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

### ADDITIONAL COMMENTS

**For 1,2-Diphenylhydrazine:**

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

Attention: Bronwyn Kelly  
Project: Annual Outfall 003  
Sampled: 02/18/05  
Del Mar Analytical Number: IOB1571

Dear Ms. Kelly:

Aquatic Testing Laboratories performed the Fathead Minnow 96 hr Percent Survival Bioassay (EPA Method 2000.0), Eberline Services performed the gross alpha/beta analyses (EPA 900.0), the tritium analysis (H-3, EPA 906.0), and the strontium analysis (SR -90 EPA 905.0), and Alta Analytical performed Method 1613 Dioxin for the project referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	ATL ID	Eberline ID	Alta ID
Outfall 003	IOB1571-01	A-05021908-001	R502214-8293	25780-001

Attached are the original reports from the subcontract laboratories. If you have any questions or require further assistance, please do not hesitate to contact me (949) 261-1022, at extension 215.

Sincerely yours,  
DEL MAR ANALYTICAL

  
Michele Harper  
Project Manager

# FATHEAD MINNOW PERCENT SURVIVAL TEST

Lab No.: A-05021908-001  
 Client/ID: Del Mar IOB1571-01

Start Date: 02/19/2005

## TEST SUMMARY

Species: *Pimephales promelas*.  
 Age: 12 (1-14) days.  
 Regulations: NPDES.  
 Test solution volume: 250 ml.  
 Feeding: prior to renewal at 48 hrs.  
 Number of replicates: 2.  
 Dilution water: Moderately hard reconstituted water.  
 Photoperiod: 16/8 hrs light/dark.

Source: In-laboratory Culture.  
 Test type: Static-Renewal.  
 Test Protocol: EPA-821-R-02-012.  
 Endpoints: Percent Survival at 96 hrs.  
 Test chamber: 600 ml beakers.  
 Temperature: 20 +/- 1°C.  
 Number of fish per chamber: 10.  
 QA/QC Batch No.: RT-050208.

Eberline Services Report R502214-8293

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 23, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

Ms. Michele Harper  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Harper,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on February 24, 2005 under your Project Name "IOB1571". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A rush turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
HRMS Services Director

**APPENDIX**

## DATA QUALIFIERS & ABBREVIATIONS

<b>B</b>	<b>This compound was also detected in the method blank.</b>
<b>D</b>	<b>The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.</b>
<b>H</b>	<b>The signal-to-noise ratio is greater than 10:1.</b>
<b>I</b>	<b>Chemical Interference</b>
<b>J</b>	<b>The amount detected is below the Lower Calibration Limit of the instrument.</b>
<b>*</b>	<b>See Cover Letter</b>
<b>Conc.</b>	<b>Concentration</b>
<b>DL</b>	<b>Sample-specific estimated detection limit</b>
<b>MDL</b>	<b>The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.</b>
<b>EMPC</b>	<b>Estimated Maximum Possible Concentration</b>
<b>NA</b>	<b>Not applicable</b>
<b>RL</b>	<b>Reporting Limit – concentrations that corresponds to low calibration point</b>
<b>ND</b>	<b>Not Detected</b>
<b>TEQ</b>	<b>Toxic Equivalency</b>

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

The control limits are "interim limits only" until in-house limits are utilized.

Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R502215-8294

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 23, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0); results for those analyses were reported on March 15. This report contains the analytical results for Ra-226 (EPA903.1) and Ra-228 (EPA904.0). The Ra-226 QC samples are 8368-005, 006, and 007, and the Ra-228 QC samples are 8263-002, 003, and 004. The QC LCS, blank analyses, and sample duplicates for both the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90 and Ra-228, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R502216-8295

Dear Ms. Harper:

Enclosed are Cs-137 gamma spectroscopy results for the solids filtered from Del Mar sample IOB1576-01. Sample IOB1576-01 was received at Eberline Services on February 23, 2005. The sample was filtered and the collected substrate was analyzed for gamma emitting radionuclides (EPA901.1). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. The parenthetical G after a nuclide indicates that the result was obtained by gamma spectroscopy. A "U" in the results column indicates that the nuclide was not detected greater than the indicated minimum detectable activity (MDA).

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

MCM/njv

**ACTION ITEMS<sup>a</sup>**

- 1. Case Narrative Deficiencies
- 2. Out of Scope Analyses
- 3. Analyses Not Conducted
- 4. Missing Hardcopy Deliverables
- 5. Incorrect Hardcopy Deliverables
- 6. Deviations from Analysis Protocol, e.g.,
  - Holding Times
  - GC/MS Tune/Inst. Performance
  - Calibrations
  - Blanks
  - Surrogates
  - Matrix Spike/Dup LCS
  - Field QC
  - Internal Standard Performance
  - Compound Identification and Quantitation
  - System Performance

Qualifications applied for:

- 1. Detector efficiency outliers.
- 2. Exceeded holding imtes.

**COMMENTS<sup>b</sup>**

<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements.  
<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

## Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB1556, IOB1557, IOB1559, IOB1570, IOB1571, IOB1576  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 8  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: March 24, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition. All tritium samples were received unpreserved in glass containers. All gross alpha, gross beta, and strontium samples were preserved, except for the Outfall 003 samples in SDG IOB1556. Outfall 003 Filtered, was filtered by Eberline and then preserved. Outfall 003 Unfiltered was not preserved. According to the Los Angeles Water Quality Control Board (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel. The transfer COCs were signed by personnel from both laboratories, except for the COC listing Outfall 003 in SDG IOB1571, which was not signed as received by Eberline. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium and preserved gross alpha, gross beta, and strontium samples were analyzed within 180 days of collection. The Outfall 003 Unfiltered gross alpha and gross beta samples were analyzed beyond the five day holding time for unpreserved samples; therefore, these gross alpha and gross beta results were qualified as estimated, "J." No further qualifications were necessary.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

#### Gross Alpha and Gross Beta

The initial calibration included with the data was performed in February 2003. The detector efficiencies for Outfall 006, Outfall 018, Outfall 003, Outfall 003 Filtered, and Outfall 003 Unfiltered were less than 20%; therefore, these results were qualified as estimated, "UJ," for nondetects and, "J," for detects. The remaining detector efficiencies were above 20%.

#### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1995. All strontium chemical yields were at least 80% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Cesium

The reviewer confirmed that the 662 KeV peak was used for quantitation, with a branch efficiency of 85%. No qualifications were necessary.

## **2.3 BLANKS**

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

Two blank spikes (8294-002 and 8295-002) were analyzed in association with the samples in these SDGs. All blank spike results were within the 3-sigma limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed duplicate analysis on Outfall 003 Filtered and Outfall 003 Substrate. All results were within the 3-sigma limits and all RPDs were  $\leq 20\%$ . No qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

The laboratory performed matrix spike analyses on Outfall 003 Unfiltered for gross alpha, gross beta, and tritium. The recovery for gross alpha was above 3-sigma; however, as the recovery of 118% was considered acceptable, no qualifications were required. The remaining recoveries were within the 3-sigma limits. No qualifications were necessary.

## **2.7 SAMPLE RESULT VERIFICATION**

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## **2.8 FIELD QC SAMPLES**

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

**2.8.1 Field Blanks and Equipment Rinsates**

The samples in these SDGs had no associated field QC samples. No qualifications were required.

**2.8.2 Field Duplicates**

There were no field duplicate samples in these SDGs.

Attention: Bronwyn Kelly  
Projects: 13267 (Study 2) / Routine Outfall 003  
Sampled: 3/19/05  
Del Mar Analytical Number: IOC1562

Dear Ms. Kelly:

Eberline Services performed the Gross Alpha/Beta (EPA 900.0), Tritium (EPA 906.0), Strontium-90 (EPA 905.0), Radium-226 (Ra-226, EPA 903.1), Radium-228 (Ra-228, EPA 904.0) and Cesium 137 by Gamma Spectroscopy (EPA 901.1) analyses for the projects referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	EBERLINE ID
Outfall 003 Filtered	IOC1562-01	R503161-01 / 8351-001
Outfall 003 Unfiltered	IOC1562-02	R503161-01 / 8351-002
Outfall 003 Substrate	IOC1562-03	R503162-01 / 8352-001

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
DEL MAR ANALYTICAL

Reference: Del Mar Analytical Project No. IOC1562  
Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R503161-8351

Dear Ms. Harper:

Enclosed are results from the analyses of two water samples received at Eberline Services on March 22 2005. The samples were analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), strontium-90 (Sr-90, EPA905.0), radium-226 (Ra-226, EPA903.1), and radium-228 (Ra-228, EPA904.0). The QC samples for gross alpha/beta, tritium, and Sr-90 are 8344-002, 003, 004, and 005; for Ra-226 the QC samples are 8368-005, 006, and 007; for Ra-228 the QC samples are 8263-002, 003, and 004. The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90 and Ra-228, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

## NPDES Monitoring

ANALYSIS: RADIONUCLIDES

SAMPLE DELIVERY GROUPS:  
IOC1523, IOC1526, IOC1562, IOC2063, & IOC2064

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOC1523, IOC1526, IOC1562, IOC2063, & IOC2064  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 10  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: May 17, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All samples were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . Eberline, the subcontract laboratory, did not provide sample receipt temperature information; however, as it is not necessary to chill radiological samples, no qualifications were required. All samples were received intact and in good condition.

All samples were received unpreserved, in glass containers. According to the Los Angeles Water Quality Control Board (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. As instructed on the transfer COCs, Eberline filtered and then preserved samples Outfall 011 Grab Filtered (IOC1523), Outfall 003 Filtered, and Outfall 011 Grab Filtered (IOC2063). The gross alpha, gross beta, strontium, radium-226, radium-228, and cesium-137 results for the remaining samples were not qualified for lack of preservation, as the methods specifies a five-day holding time for unpreserved samples.

No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. None of the COCs requested radium-226 or radium-228 analyses. These analyses were requested by M. Harper of Del Mar Analytical, as per instructions in a letter from the LARWQCB dated 3/22/05. The original and transfer COCs accounted for the samples and remaining analyses presented in this data package.

Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

All tritium analyses and all analyses for samples Outfall 011 Grab Filtered (IOC1523), Outfall 003 Filtered, and Outfall 011 Grab Filtered (IOC2063) were performed within 180 days of collection. The remaining analyses were performed beyond the five day holding time for unpreserved samples; therefore, the gross alpha, gross beta, radium-226, radium-228, strontium-90, and cesium-137 results for samples Outfall 011 Grab Unfiltered (IOC1523), Outfall 011 Grab Substrate (IOC1523), Outfall 011 Composite (IOC1526), Outfall 003 Unfiltered, Outfall 003 Substrate, Outfall 011 Grab Unfiltered (IOC2063), Outfall 011 Substrate (IOC2063), and Outfall 011 Composite (IOC2064) were qualified as estimated, "J," for detects and, "UJ," for nondetects. No further qualifications were necessary.

## 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha and Gross Beta

The initial calibration included with the data was performed in February 2003. All gross alpha detector efficiencies were below 20%; therefore, the gross alpha results were qualified as estimated, "UJ," for nondetects and, "J," for detects. All gross beta detector efficiencies were at least 20% and were considered acceptable.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1997. All strontium chemical yields were at least 65% and were considered acceptable and the strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Cesium

The reviewer confirmed that the 662 KeV peak was used for quantitation, with an efficiency of 85%. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in June 2002. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-228 and was verified in July 2001. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 90% and the actinium chemical yields were greater than 65%. No qualifications were necessary.

## 2.3 BLANKS

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Blank spikes were analyzed in association with the samples in these SDGs. Two gross alpha, two radium-228, one radium-226, one strontium-90, and one tritium LCS recoveries were outside the 3-sigma limits control limits, but all had acceptable recoveries ranging from 72- 125%. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses for gross alpha, gross beta, tritium, and strontium on Outfall 011Composite (IOC1526) and for gross alpha, gross beta, tritium, strontium, radium-226, and radium-228 on Outfall 011Grab Unfiltered (IOC2063). All results were within the 3-sigma limits and no qualifications were necessary.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

The laboratory performed matrix spike analyses for gross alpha, gross beta, and tritium on Outfall 011Composite (IOC1526) and for gross alpha, gross beta, tritium, and radium-226 on Outfall 011Grab Unfiltered (IOC2063). The Outfall 011 Grab Unfiltered gross alpha (114%), gross beta (104%), tritium (96%), and radium-226 (104%) were outside the 3-sigma control limits; however, as the recoveries were deemed acceptable, no qualifications were required. The Outfall 011 Composite gross alpha recovery outside the 3-sigma limits; however, as the 82% recovery was deemed acceptable, no qualifications were required. The remaining recoveries were within the 3-sigma limits. No qualifications were necessary.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

Attention: Bronwyn Kelly  
  
Projects: 13267 (Study 2) / Routine Outfall 003  
Sampled: 4/28/05  
Del Mar Analytical Number: IOD2061

Dear Ms. Kelly:

Eberline Services performed the Gross Alpha/Beta (EPA 900.0), Tritium (EPA 906.0), Strontium-90 (EPA 905.0), Radium-226 (Ra-226, EPA 903.1), Radium-228 (Ra-228, EPA 904.0) and Cesium 137 by Gamma Spectroscopy (EPA 901.1) analyses for the projects referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	EBERLINE ID
Outfall 003 Filtered	IOD2061-01	R505002-01 / 8442-001
Outfall 003 Unfiltered	IOD2061-02	R505002-01 / 8442-002
Outfall 003 Substrate	IOD2061-03	R505003-01 / 8443-001

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
DEL MAR ANALYTICAL

Michele Harper  
Project Manager

Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Reports R505002-8442

Dear Ms. Harper:

Enclosed is a Level IV data report (on CD) for the results of the two water samples in the above referenced Del Mar Analytical Project. The samples were received at Eberline Services on April 30, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Forms. The requested analyses for the sample were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), strontium-90 (Sr-90, EPA905.0), radium-226 (Ra-226, EPA903.1), and radium-228 (Ra-228, EPA904.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results, were all within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90 and Ra-228, do not require matrix spike analyses to be performed. Insufficient sample volume was received for a duplicate analysis to be performed. No problems were encountered during the analyses.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

### Data Qualifier Reference Table

---

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

---

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: RADIONUCLIDES

SAMPLE DELIVERY GROUP: IOD2061

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150012  
SDG#: IOD2061  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: July 14, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method
Outfall 003 Filtered	IOD2061-01	8442-001	water	900.0, 903.1, 904.0, 905.0, 906.0
Outfall 003 Unfiltered	IOD2061-02	8442-001	water	900.0, 903.1, 904.0, 905.0, 906.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

Both samples in this SDG were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition. All tritium samples were received unpreserved in glass containers. All gross alpha, gross beta, radium-226, radium-228, and strontium samples were received unpreserved. Upon receipt, the laboratory filtered and then preserved the gross alpha, gross beta, radium-226, radium-228, and strontium aliquots for Outfall 003 Filtered. As per instructions, Outfall 003 Unfiltered was not preserved. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COC was signed and dated by field and laboratory personnel. The transfer COC was signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form I; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium samples and preserved gross alpha, gross beta, radium-226, radium-228, and strontium samples for Outfall 003 Filtered were analyzed within 180 days of collection. The unpreserved gross alpha, gross beta, radium-226, radium-228, and strontium samples for Outfall 003 Unfiltered were analyzed beyond the five-day holding time; therefore, the results for gross alpha, gross beta, radium-226, radium-228, and strontium were qualified as estimated, "J," for detects and, "UJ," for nondetects. No further qualifications were necessary.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

#### Gross Alpha and Gross Beta

The initial calibration included with the data was performed in February 2003. The gross alpha detector efficiencies were both less than 20%; therefore, the nondetected gross alpha results for Outfall 003 Filtered was qualified as estimated, "UJ," and the detected gross alpha results for Outfall 003 Unfiltered was qualified as estimated, "J." The remaining detector efficiencies were above 20%.

#### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1995. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in May 2004 and October 2003. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-228 and was verified in February 2001. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 70%. And the actinium chemical yields were greater than 50%. No qualifications were necessary.

## **2.3 BLANKS**

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

Aqueous blank spikes were analyzed in association with the samples in this SDG. The radium-228 and radium-226 recoveries exceeded the 3-sigma limits; however, these recoveries, 122% and 110%, were deemed acceptable. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed duplicate analyses on Outfall 003 Filtered for all analytes except radium-228. The gross alpha RPD was greater than 20%; however, as the result was within the 3-sigma limits, no qualifications were required. All remaining RPDs were  $\leq 20\%$  and all results were within the 3-sigma limits. No qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

The laboratory performed matrix spike analyses on Outfall 003 Filtered for all analytes except radium-228 and strontium. The recoveries were all within the 3-sigma limits. No qualifications were necessary.

## **2.7 SAMPLE RESULT VERIFICATION**

An EPA Level IV review was performed for the samples in this data package. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in this SDG had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in this SDG.

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- M-3** Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- RL-1** Reporting limit raised due to sample matrix effects.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

# EBERLINE SERVICES

April 11, 2006

Ms. Michele Chamberlin  
Project Manager  
Del Mar Analytical  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Reference: Eberline Services NELAP Cert #01120CA (exp. 01/31/07)

Dear Ms. Chamberlin:

Enclosed is a Level IV data package (on CD) for the water samples in the following Del Mar Analytical Projects, the associated Eberline Services work orders are also specified:

<u>Del Mar Project #</u>	<u>Eberline Work Order</u>	<u>Sample Receipt Date</u>
IOJ1231	R510124-8615	10/21/05
IOK0900	R511134-8621	11/11/05
IPC0164	R603040-8668	03/03/06
IPC1333	R603083-8669	03/14/06

The samples were analyzed according to the accompanying Del Mar Analytical Subcontract Order Forms. The analyses of samples IOJ1231-01 and IOK0900-01 were reanalyses. The requested analysis for all samples was Sr-90 (EPA905.0). The samples were neither filtered nor preserved prior to analysis. Samples IOJ1231-01 and IOK0900-01 were analyzed in a common preparation batch, while samples IPC0164-01 and IPC1333-01 were analyzed separately with their own QC samples. The QC LCS's, blank analyses, and duplicate analyses were all within the control limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed. No problems were encountered during the analyses.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOJ1231  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: E. Wessling  
Date of Review: December 15, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Method 905.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel. The transfer COCs were signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. After all analyses were complete, Del Mar Analytical sent extra volume of Outfall 011 Grab for unfiltered reanalyses and cesium analysis of the substrate. No qualifications were required.

#### 2.1.3 Holding Times

The Outfall 003 Unfiltered strontium-90-sample was analyzed beyond the five day holding time for unpreserved samples; therefore, these results were qualified as estimated, "J"

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

#### Strontium-90

The initial calibrations were performed in June 1995. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### 2.3 BLANKS

No measurable activities were detected in the method blank, therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in this SDG. The blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on a sample other than from the site; therefore, no assessment was made for this criterion. No qualifications were necessary.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MS/MSD analyses were performed for the strontium analysis. No qualifications were necessary.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the sample in this SDG. The sample result and MDAs reported on the sample result form were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in this SDG.

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- M-NRI** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

**Alta Project I.D.: 27026**

Ms. Michele Chamberlin  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Chamberlin,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on December 08, 2005 under your Project Name "IOK0900". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A rush turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
Director of HRMS Services

*Alta Analytical Laboratory certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. This report should not be reproduced except in full without the written approval of ALTA.*

**APPENDIX**

## DATA QUALIFIERS & ABBREVIATIONS

B	This compound was also detected in the method blank.
D	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
E	The reported value exceeds the calibration range of the instrument.
H	The signal-to-noise ratio is greater than 10:1.
I	Chemical interference
J	The amount detected is below the Lower Calibration Limit of the instrument.
*	See Cover Letter
Conc.	Concentration
DL	Sample-specific estimated Detection Limit
MDL	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.
EMPC	Estimated Maximum Possible Concentration
NA	Not applicable
RL	Reporting Limit – concentrations that corresponds to low calibration point
ND	Not Detected
TEQ	Toxic Equivalency

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

# EBERLINE SERVICES

April 11, 2006

Ms. Michele Chamberlin  
Project Manager  
Del Mar Analytical  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Reference: Eberline Services NELAP Cert #01120CA (exp. 01/31/07)

Dear Ms. Chamberlin:

Enclosed is a Level IV data package (on CD) for the water samples in the following Del Mar Analytical Projects, the associated Eberline Services work orders are also specified:

<u>Del Mar Project #</u>	<u>Eberline Work Order</u>	<u>Sample Receipt Date</u>
IOJ1231	R510124-8615	10/21/05
IOK0900	R511134-8621	11/11/05
IPC0164	R603040-8668	03/03/06
IPC1333	R603083-8669	03/14/06

The samples were analyzed according to the accompanying Del Mar Analytical Subcontract Order Forms. The analyses of samples IOJ1231-01 and IOK0900-01 were reanalyses. The requested analysis for all samples was Sr-90 (EPA905.0). The samples were neither filtered nor preserved prior to analysis. Samples IOJ1231-01 and IOK0900-01 were analyzed in a common preparation batch, while samples IPC0164-01 and IPC1333-01 were analyzed separately with their own QC samples. The QC LCS's, blank analyses, and duplicate analyses were all within the control limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed. No problems were encountered during the analyses.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

MCM/njv

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: RADIONUCLIDES

SAMPLE DELIVERY GROUP:  
IOK0900

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title:	NPDES Monitoring
Contract Task Order #:	313150010
SDG#:	IOK0900
Project Manager:	P. Costa
Matrix:	Water
Analysis:	Radionuclides
QC Level:	Level IV
No. of Samples:	1
No. of Reanalyses/Dilutions:	1
Reviewer:	E. Wessling
Date of Review:	December 15, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Method 905.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method
Outfall 003	IOK0900-01	8621-001	water	905.0
Outfall 003 RE1	IOK0900-01 RE1	8621-001	water	905.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The sample was noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. Sample Outfall 003 was filtered prior to strontium analysis. As the Outfall 003 strontium analysis was not retained no qualification was required.

#### 2.1.2 Chain of Custody

The original COC was signed and dated by field and laboratory personnel. The transfer COC was signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. After all analyses were complete, Del Mar Analytical sent extra volume of Outfall 003 for unfiltered reanalyses of strontium and cesium analysis of the substrate. No qualifications were required.

#### 2.1.3 Holding Times

The Outfall 003 and Outfall 003 RE1 strontium-90-samples were analyzed beyond the five day holding time for unpreserved samples; therefore, strontium detected in Outfall 003 RE1 was qualified as estimated, "J." As the result for Outfall 003 was not retained, no qualification for the exceeded holding time was required. No further qualifications were required.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability. The initial calibrations were performed in June 1995. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### 2.3 BLANKS

No measurable activities were detected in the method blank; therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in this SDG. The blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on a sample other than from the site; therefore, no assessment was made for this criterion. No qualifications were necessary.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Analyses that involve the yielding of an analytical tracer do not require matrix spike analyses; therefore, no strontium matrix spike was performed. No qualifications were required.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the sample in this SDG. The sample result and MDAs reported on the sample result form were verified against the raw data and no calculation or transcription errors were noted.

The laboratory reanalyzed Outfall 003 for strontium, without filtering the sample aliquot, as required by the NPDES permit. As the reanalysis result, Outfall 003 RE1, was similar to the original result, the reviewer rejected, "R," the original result, Outfall 003, in favor of the reanalysis result as it was compliant with the NPDES permit. No further qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in this SDG.

Outfall 003, January 1, 2006

Del Mar Analytical Laboratory Report

LABORATORY REPORT

Prepared For: MWH-Pasadena/Boeing  
300 North Lake Avenue, Suite 1200  
Pasadena, CA 91101  
Attention: Bronwyn Kelly

Project: Routine Outfall 003

Sampled: 01/01/06  
Received: 01/01/06  
Issued: 01/13/06 16:10

NELAP #01108CA California ELAP#1197 CSDLAC #10117

*The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain of Custody, 1 page, is included and is an integral part of this report.  
This entire report was reviewed and approved for release.*

### DATA QUALIFIERS AND DEFINITIONS

- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- M-3** Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- R-3** The RPD exceeded the method control limit due to sample matrix effects.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.

**Alta Project I.D.: 27135**

Ms. Michele Chamberlin  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Chamberlin,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on January 04, 2006 under your Project Name "IPA0002". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A standard turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
Director of HRMS Services

*Alta Analytical Laboratory certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. This report should not be reproduced except in full without the written approval of ALTA.*

**APPENDIX**

## DATA QUALIFIERS & ABBREVIATIONS

B	This compound was also detected in the method blank.
D	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
E	The reported value exceeds the calibration range of the instrument.
H	The signal-to-noise ratio is greater than 10:1.
I	Chemical interference
J	The amount detected is below the Lower Calibration Limit of the instrument.
*	See Cover Letter
Conc.	Concentration
DL	Sample-specific estimated Detection Limit
MDL	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.
EMPC	Estimated Maximum Possible Concentration
NA	Not applicable
RL	Reporting Limit – concentrations that corresponds to low calibration point
ND	Not Detected
TEQ	Toxic Equivalency

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

March 21, 2006

Ms. Michele Chamberlin  
Project Manager  
Del Mar Analytical  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Reference: Del Mar Analytical Project No. IPA002  
Eberline Services NELAP Cert #01120CA (exp. 01/31/07)  
Eberline Services Report R601009-8637

Dear Ms. Chamberlin:

Enclosed are Sr-90 reanalysis results for one water sample received as the above referenced Del Mar Analytical project. Results were originally reported on January 30, 2006. The batch QC LCS, blank analysis, and sample duplicate analysis results were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require a matrix spike analysis to be performed. The reported gross alpha/gross beta QC sample results are not relevant to this report.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

*MCM/njv*

## 1. INTRODUCTION

Task Order Title: NPDES Sampling  
MEC<sup>X</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPA0002, IPA0101, IPA0102  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 3  
No. of Reanalyses/Dilutions: 3  
Reviewer: P. Meeks  
Date of Review: February 19, 2006

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 903.1, 904.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample Identification**

Outfall 009 Split RE1	IPA0102-01	8640-001	Water	905.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. The tritium samples for Outfall 002 Split and Outfall 009 Split were received unpreserved in plastic containers; therefore, both nondetected tritium results were qualified as estimated, "UJ."

According to the LARWQCB guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. Notations in an Eberline logbook indicated that all samples were filtered due to high concentrations of suspended solids but were not subsequently preserved. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel. The transfer COCs were signed by personnel from both laboratories. The radium-226 and radium-228 analyses for Outfall 002 Split and Outfall 009 Split were originally on HOLD. These analyses were requested on 01/10/06 by M. Chamberlain of Del Mar Analytical. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium samples were analyzed within 180 days of collection. As the gross alpha, gross beta, radium-226, radium-228, and strontium samples were not preserved (see section 2.1.1) and were analyzed beyond the five-day analytical holding time for unpreserved samples, all gross alpha, gross beta, radium-226, radium-228, and strontium results were qualified as estimated, "UJ," for nondetects and, "J," for detects. No further qualifications were necessary.

## 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha and Gross Beta

The initial calibration included with the data was performed in February 2003. The gross alpha detector efficiencies were all less than 20%, therefore, these results were qualified as estimated, "UJ," for nondetects and, "J," for detects. The remaining detector efficiencies were above 20%.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1995. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in January 2006. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-288 and was verified in February 2001. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 70%. And the actinium chemical yields were greater than 50%. No qualifications were necessary.

## 2.3 BLANKS

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in these SDGs. The gross alpha recovery exceeded the 3-sigma limit; however, the recovery, 80%, was deemed acceptable. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on Outfall 002 Split for all analytes and on Outfall 003 for strontium. The Outfall 002 Split strontium RPD exceeded 20%; however, as the result was within the 3-sigma limit, it was deemed acceptable. The remaining results were within the 3-sigma limits with RPDs  $\leq$ 20%. No qualifications were necessary.

## 2.6 MATRIX SPIKES

The laboratory performed matrix spike analyses on Outfall 002 Split for gross alpha, gross beta, tritium, and radium-226. The recoveries for gross alpha, gross beta, and tritium exceeded the 3-sigma limit; however, the recoveries, 88%, 88%, and 95% were considered acceptable. The radium-226 recovery was within the 3-sigma limit. No qualifications were necessary.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted.

Due to high concentrations of sediments, the laboratory filtered the original strontium aliquots, Outfall 002 Split, Outfall 003, and Outfall 009 Split. According to the LARWQCB letter dated 1/12/05, these aliquots should not have been filtered; therefore, unfiltered strontium aliquots were reanalyzed. As the reanalysis results, Outfall 002 Split RE1, Outfall 003 RE1, and Outfall 009 Split RE1, were similar to the original results, all reanalysis results were rejected. "R." in favor of the original results. No further qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

## DATA VALIDATION REPORT

NPDES Sampling  
Outfall 003 and  
Outfall 002 & Outfall 009 LARWQCB Split Samples

ANALYSIS: RADIONUCLIDES

SAMPLE DELIVERY GROUPS: IPA0002, IPA0101 & IPA0102

Prepared by

MECX, LLC  
12269 East Vassar Drive  
Aurora, CO 80014

## 1. INTRODUCTION

Task Order Title: NPDES Sampling  
MEC<sup>x</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPA0002, IPA0101, IPA0102  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 3  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: February 19, 2006

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 903.1, 904.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Table 1. Sample Identification

Client ID	Laboratory ID (Del Mar)	Laboratory ID (Eberline)	Matrix	COC Method
Outfall 003	IPA0002-01	8637-001	Water	905.0
Outfall 002 Split	IPA0101-01	8639-001	Water	900.0, 903.1, 904.0, 905.0, 906.0
Outfall 009 Split	IPA0102-01	8640-001	Water	900.0, 903.1, 904.0, 905.0, 906.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. The tritium samples for Outfall 002 Split and Outfall 009 Split were received unpreserved in plastic containers; therefore, both nondetected tritium results were qualified as estimated, "UJ."

According to the LARWQCB guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. Notations in an Eberline logbook indicated that all strontium samples were filtered due to high concentrations of suspended solids. As the filtration was a deviation from the NPDES permit, all nondetected strontium results were qualified as estimated, "UJ." No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel. The transfer COCs were signed by personnel from both laboratories. The radium-226 and radium-228 analyses for Outfall 002 Split and Outfall 009 Split were originally on HOLD. These analyses were requested on 01/10/06 by M. Chamberlin of Del Mar Analytical. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium samples were analyzed within 180 days of collection. As the gross alpha, gross beta, radium-226, radium-228, and strontium samples were not preserved (see section 2.1.1) and were analyzed beyond the five-day analytical holding time for unpreserved samples, all gross alpha, gross beta, radium-226, radium-228, and strontium results were qualified as estimated, "UJ," for nondetects and, "J," for detects. No further qualifications were necessary.

## 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha and Gross Beta

The initial calibration included with the data was performed in February 2003. The gross alpha detector efficiencies were all less than 20%; therefore, these results were qualified as estimated, "UJ," for nondetects and, "J," for detects. The remaining detector efficiencies were above 20%.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1995. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in January 2006. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-288 and was verified in February 2001. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 70%. And the actinium chemical yields were greater than 50%. No qualifications were necessary.

## 2.3 BLANKS

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in these SDGs. The gross alpha recovery exceeded the 3-sigma limit; however, the recovery, 80%, was deemed acceptable. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on Outfall 002 Split for all analytes and on Outfall 003 for strontium. The Outfall 002 Split strontium RPD exceeded 20%; however, as the result was within the 3-sigma limit, it was deemed acceptable. The remaining results were within the 3-sigma limits with RPDs  $\leq 20\%$ . No qualifications were necessary.

## 2.6 MATRIX SPIKES

The laboratory performed matrix spike analyses on Outfall 002 Split for gross alpha, gross beta, tritium, and radium-226. The recoveries for gross alpha, gross beta, and tritium exceeded the 3-sigma limit; however, the recoveries, 88%, 88%, and 95% were considered acceptable. The radium-226 recovery was within the 3-sigma limit. No qualifications were necessary.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

Del Mar Analytical Laboratory Report

LABORATORY REPORT

Prepared For: MWH-Pasadena/Boeing  
300 North Lake Avenue, Suite 1200  
Pasadena, CA 91101  
Attention: Bronwyn Kelly

Project: Annual Outfall 003

Sampled: 02/19/06  
Received: 02/19/06  
Revised: 03/28/06 17:54

NELAP #01108CA California ELAP#1197 CSDLAC #10117

*The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain(s) of Custody, 2 pages, are included and are an integral part of this report.  
This entire report was reviewed and approved for release.*

CASE NARRATIVE

- SAMPLE RECEIPT: Samples were received intact, at 3°C, on ice and with chain of custody documentation.
- HOLDING TIMES: All samples were analyzed within prescribed holding times and/or in accordance with the Del Mar Analytical Sample Acceptance Policy unless otherwise noted in the report.
- PRESERVATION: Samples requiring preservation were verified prior to sample analysis.
- QA/QC CRITERIA: All analyses met method criteria, except as noted in the report with data qualifiers. Due to QC issues, the EPA 608 analysis was re-run and the results are included in this revised report.
- COMMENTS: Results that fall between the MDL and RL are 'J' flagged.
- SUBCONTRACTED: Refer to the last page for specific subcontract laboratory information included in this report.

### CORRECTIVE ACTION REPORT

Department: Extractions

Date: 02/28/2006

Method: EPA 625

Matrix: Water

QC Batch: 6B24064

#### Identification and Definition of Problem:

The percent recovery for dimethylphthalate in the LCS was below method acceptance limits.

#### Determination of the Cause of the Problem:

A definitive cause for the QC failure has not been determined.

#### Corrective Action Taken:

All results reported for dimethylphthalate are potentially biased low and can be considered estimates only.

Quality Assurance Approval:

Dave Dawes

Received: 02/19/06

### CORRECTIVE ACTION REPORT

Department: Pesticides

Date: 03/21/2006

Method: EPA 608

Matrix: Water

QC Batch: 6B24053

#### Identification and Definition of Problem:

A continuing calibration verification (CCV) standard containing AR1016 and AR1260 was not analyzed at the method-specified frequency.

#### Determination of the Cause of the Problem:

A definitive cause for the QC failure has not been determined.

#### Corrective Action Taken:

All affected samples were bracketed by passing CCVs containing AR1016 and AR1260. Although these aroclors were not analyzed, as required, between the bracketing CCVs, other aroclor standards were, indicating that the analytical run was still within calibration criteria for aroclors in general. All affected samples were re-analyzed in a run with acceptable CCV frequency and recovery to confirm original AR1016 and AR1260 results.

Quality Assurance Approval:

Dave Dawes

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- L** Laboratory Control Sample recovery was above the method control limits. Analyte not detected, data not impacted.
- L2** Laboratory Control Sample recovery was below method control limits.
- M1** The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M7** The MS and/or MSD were above the acceptance limits. See Blank Spike (LCS).
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- R** The RPD exceeded the method control limit due to sample matrix effects. The individual analyte QA/QC recoveries, however, were within acceptance limits.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

### ADDITIONAL COMMENTS

**For 1,2-Diphenylhydrazine:**

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

Subject: Chain-of-Custody Form Analytical Request Change No. of Pages: 1  
(Including cover)

**Per Request:**  
Please make the changes listed below to the chain-of-custody analytical request form. Include this form with the final deliverables for these samples.

Del Mar Work Order #	Sample ID	Date Collected	Change(s) Requested, Not Completed	Change(s) and Method (s) Now Requested
IPB1818	Annual Outfall 003	02/19/06		Gross Alpha, Gross Beta, Sr-90 as part of the 13267 study.
IPB1818 IPB1817 IPB1811 IPB1810	Annual Outfall 003, 004, 006 & 009	02/19/06		Analyze for Total combined RA-226 & 228 only if Gross Alpha and Gross Beta exceed a permit limit (15 & 50 pCi/L respectively).
IPB1818	Annual Outfall 003	02/19/06		Analyze for Tritium only if RA-226 & 228 exceed a permit limit (5 pCi/L).
IPB1817 IPB1811 IPB1810	Annual Outfall 004, 006 & 009	2/19/06		Analyze for Tritium & Sr-90 only if RA-226 & 228 exceed a permit limit (5 pCi/L).

The reason for these changes:

- Incorrectly marked on COC form* \_\_\_\_\_
- Lack of sample volume* \_\_\_\_\_
- MWH office personnel require this change* \_\_\_\_\_ X \_\_\_\_\_
- Other: Containers mislabeled* \_\_\_\_\_

This Change Order supersedes all previous change orders submitted.

Thank you

2PB 1818

**Alta Project I.D.: 27311**

Ms. Michele Chamberlin  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Chamberlin,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on February 21, 2006 under your Project Name "IPB1818". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A standard turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
Director of HRMS Services

**APPENDIX**

### DATA QUALIFIERS & ABBREVIATIONS

B	This compound was also detected in the method blank.
D	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
E	The reported value exceeds the calibration range of the instrument.
H	The signal-to-noise ratio is greater than 10:1.
I	Chemical interference
J	The amount detected is below the Lower Calibration Limit of the instrument.
*	See Cover Letter
Conc.	Concentration
DL	Sample-specific estimated Detection Limit
MDL	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.
EMPC	Estimated Maximum Possible Concentration
NA	Not applicable
RL	Reporting Limit – concentrations that corresponds to low calibration point
ND	Not Detected
TEQ	Toxic Equivalency

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

 Client/ID: Del Mar - IPB1818-01

Start Date: 02/20/2006

**TEST SUMMARY**

Species: *Pimephales promelas*.  
 Age: 14 (1-14) days.  
 Regulations: NPDES.  
 Test solution volume: 250 ml.  
 Feeding: prior to renewal at 48 hrs.  
 Number of replicates: 2.  
 Dilution water: Moderately hard reconstituted water.  
 Photoperiod: 16/8 hrs light/dark.

Source: In-laboratory Culture.  
 Test type: Static-Renewal.  
 Test Protocol: EPA-821-R-02-012.  
 Endpoints: Percent Survival at 96 hrs.  
 Test chamber: 600 ml beakers.  
 Temperature: 20 +/- 1°C.  
 Number of fish per chamber: 10.  
 QA/QC Batch No.: RT-060202.

Eberline Services NELAP Cert #01120CA (exp. 01/31/07)  
Eberline Services Report R602147-8653

Dear Ms. Chamberlin:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 21, 2006. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), and strontium-90 (Sr-90, EPA905.0). The batch QC LCS, blank analyses, sample duplicates, and matrix spike results were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

Aurora, CO 80014

## 1. INTRODUCTION

Task Order Title: NPDES Sampling  
MEC<sup>X</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPB1810, IPB1811, IPB1817, IPB1818  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: April 1, 2006

The samples listed in Table 1 were validated based on the guidelines outlined in the USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94). Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Table 1. Sample identification

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method
Outfall 004	IPB1810-01	8650-001	water	900.0
Outfall 009	IPB1811-01	8651-001	water	900.0
Outfall 006	IPB1817-01	8652-001	water	900.0
Outfall 003	IPB1818-01	8653-001	water	900.0, 905.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4 \pm 2^\circ\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. The samples in these SDGs were preserved but were not filtered. As the requirements of the permit were not met, all results were qualified as estimated, "J," for detects and, "UJ," for nondetects. No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. The strontium analysis for Outfall 003 was requested in a memo from MWH personnel dated 2/20/06. No qualifications were required.

#### 2.1.3 Holding Times

All samples were analyzed within the 180-day analytical holding time for preserved samples. No qualifications were required.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability. All gross alpha detector efficiencies were less than 20%; therefore, all gross alpha results were qualified as estimated, "J," for detects and, "UJ," for nondetects. All strontium chemical yields were at least 75% and were considered acceptable. The strontium continuing calibration results were within the laboratory control limits. No further qualifications were required.

### 2.3 BLANKS

No measurable activities were detected in the method blanks, therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in these SDGs. The blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on Outfall 003. All results were within the 3-sigma limit limits. No qualifications were necessary.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

The laboratory performed matrix spike analyses on Outfall 003 for gross alpha and gross beta. Both recoveries were within the 3-sigma limits. Analyses that involve the yielding of an analytical tracer do not require matrix spike analyses; therefore, no strontium matrix spike was performed. No qualifications were required.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these SDGs. The sample results and MDAs reported on the sample result form were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

### DATA QUALIFIERS AND DEFINITIONS

- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- M-NRI** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

**Alta Project I.D.: 27367**

Ms. Michele Chamberlin  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Chamberlin,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on March 03, 2006 under your Project Name "IPC0164". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A standard turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
Director of HRMS Services

**APPENDIX**

## DATA QUALIFIERS & ABBREVIATIONS

B	This compound was also detected in the method blank.
D	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
E	The reported value exceeds the calibration range of the instrument.
H	The signal-to-noise ratio is greater than 10:1.
I	Chemical interference
J	The amount detected is below the Lower Calibration Limit of the instrument.
*	See Cover Letter
Conc.	Concentration
DL	Sample-specific estimated Detection Limit
MDL	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.
EMPC	Estimated Maximum Possible Concentration
NA	Not applicable
RL	Reporting Limit - concentrations that corresponds to low calibration point
ND	Not Detected
TEQ	Toxic Equivalency

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

# DATA VALIDATION REPORT

NPDES Sampling  
Multiple Outfalls

ANALYSIS: RADIONUCLIDES

SAMPLE DELIVERY GROUPS: IPC0164 & IPC1333

Prepared by

MEC<sup>X</sup>, LLC  
12269 East Vassar Drive  
Aurora, CO 80014

## 1. INTRODUCTION

Task Order Title: NPDES Sampling  
MEC<sup>x</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPC0164, IPC1333  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: April 13, 2006

The samples listed in Table 1 were validated based on the guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method
Outfall 003	IPC0164-01	8668-001	water	905.0
Outfall 003	IPC1333-01	8669-001	water	905.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

Both samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4 \pm 2^\circ\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. The samples in these SDGs were not preserved or filtered. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

Both samples were analyzed beyond the five day holding time for unpreserved samples; therefore, strontium detected in the samples was qualified as estimated, "J." No further qualifications were required.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability. All strontium chemical yields were at least 75% and were considered acceptable. No further qualifications were required.

### 2.3 BLANKS

No measurable activities were detected in the method blanks, therefore, no qualifications were necessary.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Aqueous blank spikes were analyzed in association with the samples in these SDGs. The blank spike results were within the 3-sigma limits. No qualifications were necessary.

## 2.5 LABORATORY DUPLICATES

The laboratory performed duplicate analyses on both samples in these SDGs. Both results were within the 3-sigma limit limits. No qualifications were necessary.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Analyses that involve the yielding of an analytical tracer do not require matrix spike analyses; therefore, no strontium matrix spike was performed. No qualifications were required.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these SDGs. The sample results and MDAs reported on the sample result form were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

### DATA QUALIFIERS AND DEFINITIONS

- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of limited reliability.
- M-3** Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).
- M-NRI** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

Ms. Michele Chamberlin  
Del Mar Analytical, Irvine  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Dear Ms. Chamberlin,

Enclosed are the results for the one aqueous sample received at Alta Analytical Laboratory on March 14, 2006 under your Project Name "IPC1333". This sample was extracted and analyzed using EPA Method 1613 for tetra-through-octa chlorinated dioxins and furans. A rush turnaround time was provided for this work.

The following report consists of a Sample Inventory (Section I), Analytical Results (Section II) and the Appendix, which contains the chain-of-custody, a list of data qualifiers and abbreviations, Alta's current certifications, and copies of the raw data (if requested).

Alta Analytical Laboratory is committed to serving you effectively. If you require additional information, please contact me at 916-933-1640 or by email at [mmaier@altalab.com](mailto:mmaier@altalab.com). Thank you for choosing Alta as part of your analytical support team.

Sincerely,

Martha M. Maier  
Director of HRMS Services

**APPENDIX**

## DATA QUALIFIERS & ABBREVIATIONS

B	This compound was also detected in the method blank.
D	The amount reported is the maximum possible concentration due to possible chlorinated diphenylether interference.
E	The reported value exceeds the calibration range of the instrument.
H	The signal-to-noise ratio is greater than 10:1.
I	Chemical interference
J	The amount detected is below the Lower Calibration Limit of the instrument.
*	See Cover Letter
Conc.	Concentration
DL	Sample-specific estimated Detection Limit
MDL	The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero in the matrix tested.
EMPC	Estimated Maximum Possible Concentration
NA	Not applicable
RL	Reporting Limit -- concentrations that corresponds to low calibration point
ND	Not Detected
TEQ	Toxic Equivalency

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

# EBERLINE SERVICES

April 6, 2006

Ms. Michele Chamberlin  
Project Manager  
Del Mar Analytical  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Reference: Del Mar Analytical Project No. IPC1333  
Eberline Services NELAP Cert #01120CA (exp. 01/31/07)  
Eberline Services Report R603083-8669

Dear Ms. Chamberlin:

Enclosed are results from the analyses of one water sample received at Eberline Services on March 14, 2006. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analysis was strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analysis, and duplicate analysis results for the analysis were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require a matrix spike analysis to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

MCM/njv

## 1. INTRODUCTION

Task Order Title: NPDES Sampling  
MEC<sup>x</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPC0164, IPC1333  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: April 13, 2006

The samples listed in Table 1 were validated based on the guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample Identification**

Client ID	Del Mar ID	Eberline ID	Matrix	COC Method
Outfall 003	IPC0164-01	8668-001	water	905.0
Outfall 003	IPC1333-01	8669-001	water	905.0

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

Both samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4 \pm 2^\circ\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. The samples were noted to have been received intact and in good condition.

According to the Los Angeles Regional Water Quality Control Board's (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. The samples in these SDGs were not preserved or filtered. No qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

Both samples were analyzed beyond the five day holding time for unpreserved samples; therefore, strontium detected in the samples was qualified as estimated, "J." No further qualifications were required.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability. All strontium chemical yields were at least 75% and were considered acceptable. No further qualifications were required.

### 2.3 BLANKS

No measurable activities were detected in the method blanks, therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

Aqueous blank spikes were analyzed in association with the samples in these SDGs. The blank spike results were within the 3-sigma limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed duplicate analyses on both samples in these SDGs. Both results were within the 3-sigma limit limits. No qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

Analyses that involve the yielding of an analytical tracer do not require matrix spike analyses; therefore, no strontium matrix spike was performed. No qualifications were required.

## **2.7 SAMPLE RESULT VERIFICATION**

An EPA Level IV review was performed for the samples in these SDGs. The sample results and MDAs reported on the sample result form were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## **2.8 FIELD QC SAMPLES**

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### **2.8.1 Field Blanks and Equipment Rinsates**

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### **2.8.2 Field Duplicates**

There were no field duplicate samples in these SDGs.

Del Mar Analytical Laboratory Report

LABORATORY REPORT

Prepared For: MWH-Pasadena/Boeing  
300 North Lake Avenue, Suite 1200  
Pasadena, CA 91101  
Attention: Bronwyn Kelly

Project: Quarterly Outfall 011 + 13267

Sampled: 01/04/05  
Received: 01/04/05  
Issued: 03/08/05 16:13

NELAP #01108CA California ELAP#1197 CSDLAC #10117

*The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain(s) of Custody, 3 pages, are included and are an integral part of this report.  
This entire report was reviewed and approved for release.*

CASE NARRATIVE

- SAMPLE RECEIPT: Samples were received intact, at 4°C, on ice and with chain of custody documentation.
- HOLDING TIMES: Not all holding times were met. Results were qualified where the sample analysis did not occur within method specified holding time requirements.
- PRESERVATION: Samples requiring preservation were verified prior to sample analysis.
- QA/QC CRITERIA: All analyses met method criteria, except as noted in the report with data qualifiers.
- COMMENTS: Results that fall between the MDL and RL are 'J' flagged. There was a dilution for the MBAS analysis due to emulsion.
- SUBCONTRACTED: Refer to the last page for specific subcontract laboratory information included in this report.

### CORRECTIVE ACTION REPORT

Department: Extractions

Date: 01/14/2005

Method: EPA 625

Matrix: Water

QC Batch: 5A05039

#### Identification and Definition of Problem:

The percent recoveries for benzidine in the LCS and LCSD were below method acceptance limits.

#### Determination of the Cause of the Problem:

Benzidine is known to be a problematic compound. According to the EPA, it can be subject to oxidative losses during solvent extraction and its chromatographic behavior is poor.

#### Corrective Action Taken:

All results reported for benzidine are potentially biased low and can be considered estimates only.

Quality Assurance Approval:

Dave Dawes

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- H-1** Sample analysis performed past the method-specified holding time per client's approval.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of unknown quality.
- L** Laboratory Control Sample recovery was above the method control limits. Analyte not detected, data not impacted.
- L2** Laboratory Control Sample recovery was below method control limits.
- M2** The MS and/or MSD were below the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- R-7** LFB/LFBD RPD exceeded the method control limit. Recovery met acceptance criteria.
- RL-1** Reporting limit raised due to sample matrix effects.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

### ADDITIONAL COMMENTS

**For TICs:**

All identifications are tentative and concentrations are estimates based upon spectral comparison to the EPA/NIH library.

**For 1,2-Diphenylhydrazine:**

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

**For GRO (C4-C12):**

GRO (C4-C12) is quantitated against a gasoline standard. Quantitation begins immediately following the methanol peak.

**For Extractable Fuel Hydrocarbons (EFH, DRO, ORO):**

Unless otherwise noted, Extractable Fuel Hydrocarbons (EFH, DRO, ORO) are quantitated against a Diesel Fuel Standard.

Subject: Chain-of-Custody Form Analytical Request Change No. of Pages: 2  
(including cover)

**Per Request:**  
 Please make the changes listed below to the chain-of-custody analytical request form. Include this form with the final deliverables for these samples.

Del Mar Work Order #	Sample ID	Date Collected	Change(s) Requested, Not Completed	Change(s) and Method (s) Now Requested
IOB0988	Outfall 003	02/11/05	Annual Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg, B, V, Al, +PP; TCDD (and all congeners); Oil and Grease (EPA 413.1); Cl-, SO4, N)3+NO2-N, Perchlorate; TDS, TSS VOCs (624); VOCs, A+A+2CVF; NPDES + PP; Pesticides/PCBs-PP; Gross Alpha, Gross Beta, Tritium (906.0), Sr-90, Total Combined Radium 226&228; SVOCs - PP; Acute toxicity; Cyanide.	Routine Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg; TCDD (and all congeners); Oil and Grease (EPA 413.1); TDS, TSS.
IOB1002	Outfall 004	02/11/05	Annual Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg, B, V, Al, +PP; TCDD (and all congeners); Oil and Grease (EPA 413.1); Cl-, SO4, N)3+NO2-N, Perchlorate; TDS, TSS VOCs (624); VOCs, A+A+2CVF; NPDES + PP; Pesticides/PCBs-PP; Gross Alpha, Gross Beta, Tritium (906.0), Sr-90, Total Combined Radium 226&228; SVOCs - PP; Acute toxicity; Cyanide.	Routine Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg; TCDD (and all congeners); Oil and Grease (EPA 413.1); TDS, TSS.
IOB0990	Outfall 005	02/11/05	Annual Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg, B, V, Al, +PP; TCDD (and all congeners); Oil and Grease (EPA 413.1); Cl-, SO4, N)3+NO2-N, Perchlorate; TDS, TSS VOCs (624); VOCs, A+A+2CVF; NPDES + PP; Pesticides/PCBs-PP; Gross Alpha, Gross Beta, Tritium (906.0), Sr-90, Total Combined Radium 226&228; SVOCs - PP; Acute toxicity; Cyanide.	Routine Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg; TCDD (and all congeners); Oil and Grease (EPA 413.1); TDS, TSS.

IOB0992	Outfall 006	02/11/05	Annual Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg, B, V, Al, +PP; TCDD (and all congeners); Oil and Grease (EPA 413.1); Cl-, SO4, N)3+NO2-N, Perchlorate; TDS, TSS VOCs (624); VOCs, A+A+2CVE; NPDES + PP; Pesticides/PCBs-PP; Gross Alpha, Gross Beta, Tritium (906.0), Sr-90, Total Combined Radium 226&228; SVOCs - PP; Acute toxicity; Cyanide.	Routine Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg; TCDD (and all congeners); Oil and Grease (EPA 413.1); TDS, TSS.
IOB1008	Outfall 018	02/11/05	Annual Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg, B, V, Al, +PP; TCDD (and all congeners); Oil and Grease (EPA 413.1); Cl-, SO4, N)3+NO2-N, Perchlorate; TDS, TSS VOCs (624); VOCs, A+A+2CVE; NPDES + PP; Pesticides/PCBs-PP; Gross Alpha, Gross Beta, Tritium (906.0), Sr-90, Total Combined Radium 226&228; SVOCs - PP; Acute toxicity; Cyanide.	Routine Constituents per 2004 NPDES Permit - Total Recoverable Metals: Sb, Cd, Cu, Pb, Hg; TCDD (and all congeners); Oil and Grease (EPA 413.1); TDS, TSS.
IOB1014	Outfall 011	02/11/04	Chromium IV	
IOA0131	Outfall 011 -- Composite	01/04/05		Ammonia, BOD, Chloride, Nitrate/Nitrite as N, Oil and Grease, Sulfate, MBAS, TDS, TSS, TOC, Settleable Solids, Turbidity, Cr, Cyanide, perchlorate, Conductivity, Cu, Hg, TCDD
IOA0121	Outfall 011 - Grab	01/04/05		Total Recoverable Hydrocarbons, Extractable Fuel Hydrocarbons, GRO, Fluoride, Residual Chlorine, TOC, Cr VI, 1,4-Dioxane, Monomethyl Hydrazine, Bioassays, SVOC (625)-PP list, Pes/PCB-PP list (608), Total Recoverable Metals, Cyclohexane & Freon 123a & A+A+2CVE (624), Radchem

The reason for these changes:

*Incorrectly marked on COC form*

*Lack of sample volume*

*MWH office personnel require this change*

*Other: Containers mislabeled*

Attention: Bronwyn Kelly  
Project: 13267 (Study 1)  
Outfall 011 Grab  
Sampled: 1/4/05  
Del Mar Analytical Number: IOA0121

Dear Ms. Kelly:

Aquatic Testing Laboratories performed the Fathead Minnow 96hr Percent Survival Bioassay by EPA Method 2000.0 and Ceriodaphnia Survival and Reproduction Test by EPA Method 1002, Eberline Services performed Gross Alpha/Gross Beta (EPA 900.0), Tritium (H-3, EPA 906.0), and Strontium-90 (Sr-90, EPA 905.0), Pace Analytical performed the TCDD analysis by USEPA Method 1613B, and Truesdail Laboratories performed the Hydrazines by EPA 8315B for the project referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	ATL ID	EBERLINE ID	PACE ID	TRUESDAIL ID
Outfall 011-Grab	IOA0121-01	A-05010506-001/002	R501014/8148-001	105776001	938344-1

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
DEL MAR ANALYTICAL

  
Michele Harper  
Project Manager

## FATHEAD MINNOW PERCENT SURVIVAL TEST

Lab No.: A-05010506-001  
 Client/ID: Del Mar - IOA0121-01

Start Date: 01/05/2005

### TEST SUMMARY

Species: *Pimephales promelas*.  
 Age: 11 (1-14) days.  
 Regulations: NPDES.  
 Test solution volume: 250 ml.  
 Feeding: prior to renewal at 48 hrs.  
 Number of replicates: 2.  
 Dilution water: Moderately hard reconstituted water.  
 Photoperiod: 16/8 hrs light/dark.

Source: In-laboratory Culture.  
 Test type: Static-Renewal.  
 Test Protocol: EPA-821-R-02-012.  
 Endpoints: Percent Survival at 96 hrs.  
 Test chamber: 600 ml beakers.  
 Temperature: 20 +/- 1°C.  
 Number of fish per chamber: 10.  
 QA/QC Batch No.: RT-050104.

### TEST DATA

**Comments:**

Sample as received: Chlorine: 0 mg/l; pH: 7.1; Conductivity: 100 umho; Temp: 6°C;  
 DO: 10.7 mg/l; Alkalinity: 22 mg/l; Hardness: 39 mg/l; NH<sub>3</sub>-N: 0.5 mg/l.  
 Sample aerated moderately (approx. 500 ml/min) to raise or lower DO? Yes / (No)  
 Control: Alkalinity: 58 mg/l; Hardness: 96 mg/l; Conductivity: 300 umho.  
 Test solution aerated (not to exceed 100 bubbles/min) to maintain DO >4.0 mg/l? Yes / (No)  
 Sample used for renewal is the original sample kept at 0-6°C with minimal headspace.

### RESULTS

Percent Survival In: Control: 100 %    100% Sample: 100 %

**CERIODAPHNIA CHRONIC BIOASSAY  
EPA METHOD 1002.0**

Lab No.: A-05010506-002  
Client/ID: Del Mar IOA0121-01

Date Tested: 01/05/05 to 01/11/05

**TEST SUMMARY**

Test type: Daily static-renewal.  
Species: *Ceriodaphnia dubia*.  
Age: < 24 hrs; all released within 8 hrs.  
Test vessel size: 30 ml.  
Number of test organisms per vessel: 1.  
Temperature: 25 +/- 1°C.  
Dilution water: Mod. hard reconstituted (MHRW).  
QA/QC Batch No.: RT-050104.

Endpoints: Survival and Reproduction.  
Source: In-laboratory culture.  
Food: .1 ml YTC, algae per day.  
Test solution volume: 15 ml.  
Number of replicates: 10.  
Photoperiod: 16/8 hrs. light/dark cycle.  
Test duration: 7 days.  
Statistics: ToxCalc computer program.

**RESULTS SUMMARY**

Sample Concentration	Percent Survival	Mean Number of Young Per Female
Control	100%	23.4
6.25%	100%	21.3
12.5%	100%	22.0
25%	100%	23.9
50%	100%	20.1
100%	100%	20.7

\* Statistically significantly less than control at P = 0.05 level.  
\*\* Reproduction data from concentrations greater than survival NOEC are excluded from statistical analysis.

**CHRONIC TOXICITY**

Parameter	Survival	Growth
NOEC	100%	100%
TUc	1.0	1.0

**QA/QC TEST ACCEPTABILITY**

Parameter	Result
Control survival ≥80%	Pass (100% survival)
≥15 young per surviving control female	Pass (23.4 young)
≥60% surviving controls had 3 broods	Pass (80% with 3 broods)
PMSD <47% for reproduction; if >47% and no toxicity at IWC, the test must be repeated	Pass (PMSD = 32.4%)
Statistically significantly different concentrations relative difference >13%	NA - No stat. sig. diff. concentrations
Concentration response relationship acceptable	Pass (slight response at conc. tested)

Eberline Services Report R501014-8148

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on January 6, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

SAMPLE RECEIPT CHECKLIST

Client: Del Mar City: Irvine State: CA

Date/Time received: 1-06-05 10:00 CoC No.: IOA0121

Container I.D. No.: Styrofoam in Card board Requested TAT (Days): 14 P.O. Received Yes [ ] No [ ]

**INSPECTION**

1. Custody seals on shipping container intact? Yes [ ] No [ ] N/A [X]

2. Custody seals on shipping container dated & signed? Yes [ ] No [ ] N/A [X]

3. Custody seals on sample containers intact? Yes [ ] No [ ] N/A [X]

4. Custody seals on sample containers dated & signed? Yes [ ] No [ ] N/A [X]

5. Packing material is: Wet [X] Dry [ ]

6. Number of samples in shipping container: 1 Sample Matrix: water

7. Number of containers per sample: 1 (Or see CoC \_\_\_\_\_)

8. Samples are in correct container Yes [X] No [ ]

9. Paperwork agrees with samples? Yes [ ] No [X]

10. Samples have: Tape [ ] Hazard labels [ ] Rad labels [ ] Appropriate sample labels [X]

11. Samples are: In good condition [X] Leaking [ ] Broken Container [ ] Missing [ ]

12. Samples are: Preserved [ ] Not preserved [X] pH 7 Preservative \_\_\_\_\_

13. Describe any anomalies: Shipping container received wet due to lost ice not lost sample. Styrofoam container broken, not reusable. Also CoC indicates samples collected in year 2006

14. Was P.M. notified of any anomalies? Yes [X] No [ ] Date: 1-06-05

15. Inspected by: J.H. King Date: 1-06-05 Time: 10:00

## Case Narrative

**Sample Receipt** The sample was received in good condition and no anomalies were noted during check-in. The sample was kept in a locked refrigerator until analysis. Thereafter, it is being kept in ambient storage for an additional 2 months before disposal.

**Analysis** The analysis was performed as requested on the chain-of-custody.

**Quality Control** The analytical results for each batch of samples performed include a minimum of one set of laboratory control sample/laboratory control sample duplicate (LCS/LCSD), one matrix spike (MS) and a reagent blank (Method blank). Any exceptions or problems would be noted in the "comments" section.

**Comments** The test results in this report meet all quality assurance requirements set forth by the method specification and all quality control recoveries were within the laboratory acceptance limits. No anomalies or nonconformance events occurred during the course of analysis.

## 1. INTRODUCTION

Task Order Title: NPDES  
MEC<sup>X</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPB2637, IPB2639, IPB2641, IPB2643  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 4  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: April 8, 2006

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Outfall 011	952268	IPB2641-01	Water	8315
Outfall 018	952265	IPB2643-01	Water	8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for these SDGs noted that the samples were received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs from the field to Del Mar were signed and dated by field and laboratory personnel, and the transfer COCs from Del Mar to Truesdail Laboratories were signed and dated by personnel from both laboratories. The original COCs and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported and therefore, validated. Custody seals were not required as the samples were transported to Del Mar and then to Truesdail by courier. Truesdail Laboratories did not list the client IDs on the Form Is; therefore, the reviewer hand-corrected the Form Is to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analysis. The samples were extraction within the three-day holding time and analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibrations were analyzed 03/03/06, with correlation coefficients of  $\geq 0.995$  for all three hydrazines. The ICV and CCV bracketing the sample analyses had hydrazine recoveries within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with these SDGs. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate pair was analyzed with these SDGs. The hydrazine recoveries and RPDs were within the laboratory-established control limits. No qualifications were required.

### 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

### 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on Outfall 002. The hydrazines recoveries and RPDs were within the laboratory-established control limits. No qualifications were required.

### 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

#### 2.7.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC. No qualifications were required.

#### 2.7.2 Field Duplicates

There were no field duplicate samples in these SDGs.

## 2.8 COMPOUND IDENTIFICATION

The samples were analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Review of the sample chromatogram, retention times, and spectra indicated no problems with target compound identification. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. As there were no sample detects, compound quantification was verified from the raw data by recalculating LCS/LCSD and MS/MSD detects. No calculation or transcription error were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

### Data Qualifier Reference Table

---

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

---

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

NPDES  
Monitoring

ANALYSIS: METALS

SAMPLE DELIVERY GROUPS: IOA0131

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0131  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Metals  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: K. Okonzak-Lowry  
Date of Review: February 15, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels III and IV ICP-MS Metals, (DVP-5-A, Rev.0)*, *AMEC Data Validation Procedure for Levels III and IV ICP Metals (DVP-5, Rev. 0)*, *SW-846 Method 6020B for Inductively Coupled Plasma – Mass Spectrometry*, *SW-846 Method 6010B for Inductively Coupled Plasma*, *SW-846 Method 7471A for Mercury (Manual Cold-Vapor Technique)*, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the “R” data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Outfall 011	Outfall 011	IOA0131-01	water	ILM04

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No sample preservation, handling, or transport problems were noted, and no qualifications were necessary.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel. The COC requested only a few of the presented analytes. The remaining analytes were requested in a memo from MWH personnel dated 02/16/05. No sample qualifications were required.

#### 2.1.3 Holding Times

The date of collection recorded on the COC and the dates of analyses recorded in the raw data, documented that the sample analyses were performed within the specified holding times of six months for the ICP/MS and ICP metals and 28 days for mercury. No qualifications were required.

### 2.2 ICP-MS TUNING

A precalibration routine must be completed prior to calibrating the instrument, which consists of analyzing a tuning solution to verify resolution, mass calibration, and thermal stability. The solution must be analyzed a minimum of five times and must contain isotopes representing all mass regions of interest. The laboratory performed the required tune solution analyses but did not report %RSDs. The laboratory SOP states that to be acceptable, the %RSD must be less than 5%. The mass calibrations were within 0.1 amu of the true mass and the instrument resolutions were less than 0.75 amu at 5 percent peak height for all analytes in the tune solution. No site sample qualifications were required.

### 2.3 CALIBRATION

The ICV and CCV results showed acceptable recoveries, 90-110% for ICP and ICP/MS and 80-120% for mercury. The applicable reporting limit check standards were recovered within the AMEC control limits of 70-130%. No sample qualifications were required.

## 2.4 BLANKS

There were detects and negative results reported for the method blanks and bracketing ICBs/CCBs associated with the sample in this SDG. Arsenic and silver were detected in a bracketing CCB at 0.63305 and 0.36341  $\mu\text{g/L}$ , respectively; therefore, the arsenic and silver detected in sample Outfall 011 were qualified "UJ." Selenium was detected in both bracketing CCBs at 0.90784 and 0.80914  $\mu\text{g/L}$ , respectively; therefore, the selenium detected in sample Outfall 011 was qualified "UJ." No further qualifications were required due to the method and calibration blank results.

## 2.5 ICP INTERFERENCE CHECK SAMPLE (ICS A/AB)

No ICPMS interference check samples were analyzed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

An ICSA analysis was included in the raw data for the ICP boron analysis. This ICSA analysis was performed two days before the site sample analysis and was not associated with the initial calibration performed for sample Outfall.011. The laboratory's ICP SOP No. MET-200.7/6010B, Revision 8, states that the ICSA and ICSAB samples need to be run consecutively at the beginning and end of each analytical run. Due to the low level of matrix interferences in the site sample matrix, no sample qualifications were required due to the ICP ICS analysis.

## 2.6 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The ICP/MS LCS sample was identified as 5A05092-BS1, the ICP LCS sample was identified as 5A06063-BS1, and the Hg LCS sample was identified as 5A06051-BS1. The LCS results on the summary forms and in the raw data were within the laboratory-established ICP/MS, ICP, and Hg control limits of 85-115%. No qualifications were required.

## 2.7 LABORATORY DUPLICATES

No MS/MSD or duplicate analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.8 MATRIX SPIKE

No MS/MSD analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

## **2.10 ICP/MS AND ICP SERIAL DILUTION**

No serial dilution analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## **2.11 INTERNAL STANDARDS PERFORMANCE**

The ICP and ICP-MS internal standard recoveries for the site sample and associated QC sample analyses were within the 60-125% control limits and no qualifications were required.

## **2.12 SAMPLE RESULT VERIFICATION**

A Level IV review was performed for the samples in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. Analytes detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

## **2.13 FIELD QC SAMPLES**

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### **2.13.1 Field Blanks and Equipment Rinsates**

The sample in this SDG had no associated field QC samples. No qualifications were required.

### **2.13.2 Field Duplicates**

There were no field duplicate analyses performed in association with the site sample.

A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*#

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: DIOXINS/FURANS

SAMPLE DELIVERY GROUPS: IOA0121

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Dioxins/Furans  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 1  
Reviewer: K. Shadowlight  
Date of Review: February 18, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Dioxins and Furans (DVP-19, Rev. 1)*, *EPA Method 1613*, and the *National Functional Guidelines For Chlorinated Dioxin/Furan Data Review (8/02)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample Identification**

Client ID	Laboratory ID (Del Mar)	Laboratory ID (Pace)	Matrix	COC Method
Outfall 011	IOA0121-01	105776001	water	1613
Outfall 011	IOA0121-01RE	105776001R1	water	1613

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The sample was subcontracted to Pace Analytical for dioxin/furan analysis. The sample was received at Pace Analytical Services below the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ ; however, as the sample was not noted to have been frozen or damaged, no qualifications were required. The sample was received in good condition at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC and transfer COC were signed by the appropriate field and laboratory personnel, and accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory (Del Mar Analytical), custody seals were not required. There was no information regarding custody seals upon receipt at Pace. No qualifications were required.

#### 2.1.3 Holding Times

The sample was extracted and analyzed within a year of collection. No qualifications were required.

### 2.2 INSTRUMENT PERFORMANCE

Following are findings associated with instrument performance:

#### 2.2.1 GC Column Performance

A column performance standard was combined with the daily calibration verification and analyzed at the beginning of each analytical sequence. The GC column performance was acceptable with the chromatographic separation of 2,3,7,8-TCDD and other TCDD isomers resolved with a valley of  $\leq 25\%$ . No qualifications were required.

#### 2.2.2 Mass Spectrometer Performance

The mass spectrometer performance could not be evaluated as the laboratory did not provide selected ion current profiles for the lock-mass ions. No qualifications were required.

## 2.3 CALIBRATION

### 2.3.1 Initial Calibration

There was one initial calibration associated with the retained analysis of this SDG. The initial calibration was analyzed 11/29/04 on Instrument 10MSHR06. The calibration consisted of five concentration level standards (CS1 through CS5) analyzed to verify instrument linearity. The initial calibration was acceptable with %RSDs  $\leq 20\%$  for the 15 native compounds (calibration by isotope dilution) and  $\leq 35\%$  for the 2 native and all labeled compounds (calibration by internal standard). The relative retention times and ion abundance ratios were within the QC limits listed in Method 1613 for all standards. A representative number of %RSDs were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

### 2.3.2 Continuing Calibration

Calibration verification (VER) consisted of a mid-level standard (CS3) analyzed at the beginning of each analytical sequence. The VER was acceptable with the concentrations within the acceptance criteria listed in the Table 6 of the EPA Method 1613. The ion abundance ratios and relative retention times were within the method QC limits. A representative number of %Ds were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.4 BLANKS

There was one method blank (Blank-6159) extracted and analyzed with the retained analysis of this SDG. Target compounds 1,2,3,4,6,7,8-HpCDF, total HpCDF, 1,2,3,4,6,7,8-HpCDD, and total HpCDD were reported at trace levels; however, OCDF and OCDD were reported above the detection limits at 180pg/L and 220pg/L, respectively. Sample Outfall 011 was re-extracted and reanalyzed with a new method blank (Blank-6241). Dioxin/furan compounds were reported at trace levels in Blank-6241; however, trace amounts of PeCDF, PeCDD, HxCDF, and HxCDD were reported in the re-extraction analysis of Outfall 011, which was not characteristic of the sample. According to a memo from the laboratory, dated March 11, 2005, the trace concentrations of PeCDF, PeCDD, HxCDF, and HxCDD were considered to be cross-contamination from a laboratory spike. The reextraction analysis of Outfall 011 was therefore, rejected, "R," in favor of the original analysis. Any detects for the aforementioned target compounds reported at concentrations  $< 5\times$  the concentrations reported in the method blank were qualified as estimated nondetects "UJ," at the levels of interference in sample Outfall 011. The detect for total HpCDF was qualified as estimated, "J," in Outfall 011, as a portion of the total concentration was attributed to method blank contamination. Target compound 1,2,3,6,7,8-HxCDD was reported as an EMPC in the method blank. A review of the method blank raw data and chromatograms indicated no false negatives or false positives. No further qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One LCS/LCSD pair (LCS-6160/LCSD-6161) was extracted and analyzed with the retained analysis of the sample in this SDG. All recoveries were within the acceptance criteria listed in Table 6 of the Method 1613. There are no method QC limits established for RPDs. The reported RPDs were within  $\pm 20\%$ . No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were not performed in this SDG. Evaluation of method accuracy and precision was based on the LCS/LCSD results. No qualifications were required.

## 2.7 FIELD QC SAMPLES

Following are findings associated with field QC:

### 2.7.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.7.2 Field Duplicates

No field duplicate samples were identified for this SDG.

## 2.8 INTERNAL STANDARDS

The labeled standard recoveries were within the acceptance criteria listed in Table 7 of Method 1613. No qualifications were required.

## 2.9 COMPOUND IDENTIFICATION

The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613. The compound identifications were verified from the raw data and no false negatives or positives were noted. No qualifications were required.

## 2.10 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was verified from the raw data. The laboratory calculated and reported compound-specific detection limits. Any detects below the lower method calibration limit (MCL) were qualified as estimated, "J." No further qualifications were required.

## NPDES Monitoring

ANALYSIS: HYDRAZINES

SAMPLE DELIVERY GROUPS: IOC2063 & IOC2064

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOC2063, IOC2064  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 2  
Reviewer: P. Meeks  
Date of Review: April 11, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**DATA VALIDATION REPORT**

Project: NPDES  
SDG No.: IOC2063, 2064  
Analysis: Hydrazines

**Table 1. Sample identification**

EPA ID	Del Mar ID	Laboratory ID	Matrix	COC Method
Outfall 011 Grab	IOC2063-01	941100	water	Hydrazines by 8315
Outfall 011 Composite	IOC2064-01	941101	water	Hydrazines by 8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for these SDGs noted that the samples were received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs from the field to Del Mar were signed and dated by field and laboratory personnel, and the transfer COCs from Del Mar to Truesdail Laboratories were signed and dated by personnel from both laboratories. Both the original COCs and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported. As the samples were transported to Del Mar and then to Truesdail by courier, no custody seals were required. Truesdail Laboratories did not list the Outfall 011 IDs on the Form Is; therefore, the reviewer hand-corrected the Form Is to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analysis. The samples were extraction within the three-day holding time and analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibration were analyzed 03/29/05, with correlation coefficients of  $\geq 0.995$  for the hydrazines. The ICV and CCV bracketing the sample analyses had recoveries for the hydrazines within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with these SDGs. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate was analyzed with these SDGs. The hydrazines were recovered within the laboratory-established control limits of 70%-130%, and the RPDs were within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on Outfall 011 Composite. The hydrazines were recovered within the laboratory-established control limits of 0%-150%; however, both recoveries were  $\geq 10\%$ . The RPDs were within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

### 2.7.1 Field Blanks and Equipment Rinsates

The site samples in these SDGs had no associated field QC. No qualifications were required.

### 2.7.2 Field Duplicates

There were no field duplicate samples in these SDGs.

## 2.8 COMPOUND IDENTIFICATION

The samples were analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Compound identification was verified, and review of the raw data indicated no compound identification errors. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified from the raw data at a Level IV data validation by recalculating LCS/LCSD and MS/MSD detects, as there were no sample detects. No compound quantitation problems were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

# DATA VALIDATION REPORT

NPDES  
Monitoring

ANALYSIS: HYDRAZINES

SAMPLE DELIVERY GROUP: IOA0121 & IOA0131

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0121 & IOA0131  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 2  
Reviewer: P. Meeks  
Date of Review: February 10, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

EPA ID	Del Mar ID	Laboratory ID	Matrix	COC Method
Outfall 011	IOA0121-01	938344	water	Hydrazines by 8315
Outfall 011	IOA0131-01	938345	water	Hydrazines by 8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs from the field to Del Mar were signed and dated by field and laboratory personnel, and the transfer COCs from Del Mar to Truesdail Laboratories were signed and dated by personnel from both laboratories. The transfer COCs accounted for the samples. The original COC for the Outfall 011 grab sample in SDG IOA0121 did not request hydrazine analyses while the original COC for the Outfall 011 composite sample in SDG IOA0131 did request monomethyl hydrazine analysis. Both transfer COCs requested only monomethyl hydrazine; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported. A memo from MWH personnel dated 02/15/05 requested monomethyl hydrazine analysis for the Outfall 011 grab sample in SDG IOA0121.

The case narratives for these SDGs noted that the samples were received intact. As the samples were transported to Del Mar by courier, no custody seals were required. No custody seals were present upon arrival at Truesdail Laboratories. Truesdail Laboratories did not list the Outfall 011 IDs on the Form Is; therefore, the reviewer hand-corrected the Form Is to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding time was assessed by comparing the dates of collection with the date of analysis. The three-day extraction holding time for the hydrazine analysis was met and the samples were analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibrations were analyzed 01/07/05, with correlation coefficients of  $\geq 0.995$  for the hydrazines. The ICV and CCV bracketing the sample analyses had recoveries for the hydrazines within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with these SDGs. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate was analyzed with these SDGs. The hydrazines were recovered within the laboratory-established control limits of 70%-130%, and the RPD was within the control limit of  $\leq 20\%$ . No qualifications were required.

### 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

### 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on the Outfall 011 composite sample in SDG IOA0131. The recoveries for the hydrazines were within the laboratory QC limits of 0-150%; however, both recoveries were  $\geq 10\%$ . The RPDs were within the QC limit of  $\leq 20\%$ . No qualifications were required.

### 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

#### 2.7.1 Field Blanks and Equipment Rinsates

The site samples in these SDGs had no associated field QC. No qualifications were required.

#### 2.7.2 Field Duplicates

There were no field duplicate samples in these SDGs.

### 2.8 COMPOUND IDENTIFICATION

The samples were analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Compound identification was verified, and review of the raw data indicated no compound identification errors. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified from the raw data, at a Level IV data validation by recalculating LCS/LCSD and MS/MSD detects, as there were no sample detects. No compound quantitation problems were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

NPDES  
Monitoring

ANALYSIS: METALS

SAMPLE DELIVERY GROUPS: IOA0121

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Metals  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: February 18, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels III and IV ICP-MS Metals, (DVP-5-A, Rev.0)*, *AMEC Data Validation Procedure for Levels III and IV ICP Metals (DVP-5, Rev. 0)*, *SW-846 Method 6020B for Inductively Coupled Plasma – Mass Spectrometry*, *SW-846 Method 6010B for Inductively Coupled Plasma*, *SW-846 Method 7471A for Mercury (Manual Cold-Vapor Technique)*, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Outfall 011	Outfall 011	IOA0121-01	water	ILM04

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No sample preservation, handling, or transport problems were noted, and no qualifications were necessary.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel. The COC requested only a few of the presented analytes. The remaining analytes were requested in a memo from MWH personnel dated 02/16/05. No sample qualifications were required.

#### 2.1.3 Holding Times

The date of collection recorded on the COC and the dates of analyses recorded in the raw data, documented that the sample analyses were performed within the specified holding times of six months for the ICP/MS and ICP metals and 28 days for mercury. No qualifications were required.

### 2.2 ICP-MS TUNING

A precalibration routine must be completed prior to calibrating the instrument, which consists of analyzing a tuning solution to verify resolution, mass calibration, and thermal stability. The solution must be analyzed a minimum of five times and must contain isotopes representing all mass regions of interest. The laboratory performed the required tune solution analyses but did not report %RSDs. The laboratory SOP states that to be acceptable, the %RSD must be less than 5%. The mass calibrations were within 0.1 amu of the true mass and the instrument resolutions were less than 0.75 amu at 5 percent peak height for all analytes in the tune solution. No site sample qualifications were required.

### 2.3 CALIBRATION

The ICV and CCV results showed acceptable recoveries, 90-110% for ICP and ICP/MS and 80-120% for mercury. The chromium and iron reporting limit check standard recoveries were below the control limit; therefore, chromium and iron detected in Outfall 011 were qualified as estimated, "J." The remaining reporting limit check standards were recovered within the AMEC control limits of 70-130%. No further sample qualifications were required.

## 2.4 BLANKS

There were detects and negative results reported for the method blanks and bracketing ICBs/CCBs associated with the sample in this SDG. Arsenic and antimony were detected in a bracketing CCB at 0.633 and 0.415  $\mu\text{g/L}$ , respectively; therefore, arsenic and antimony detected in Outfall 011 were qualified as estimated, "UJ." No further qualifications were required due to the method and calibration blank results.

## 2.5 ICP INTERFERENCE CHECK SAMPLE (ICS A/AB)

No ICPMS interference check samples were analyzed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

An ICSA analysis was included in the raw data for the ICP boron analysis. The recoveries for the interferences were within the control limits of 80-120%. No sample qualifications were required due to the ICP ICS analysis.

## 2.6 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The ICP/MS LCS sample was identified as 5A05092-BS1, the ICP LCS sample was identified as 5A05093-BS1, and the Hg LCS sample was identified as 5A06051-BS1. The LCS results on the summary forms and in the raw data were within the laboratory-established ICP/MS, ICP, and Hg control limits of 85-115%. No qualifications were required.

## 2.7 LABORATORY DUPLICATES

MS/MSD analyses were performed on Outfall 011. The RPDs were less than the control limit of 20% and no qualifications were required.

## 2.8 MATRIX SPIKE

MS/MSD analyses were performed on Outfall 011. The recoveries for iron were below the control limit; therefore, iron detected in Outfall 011 was qualified as estimated, "J." The remaining recoveries were within the AMEC control limits of 75-125 and no further qualifications were required.

## 2.9 FURNACE ATOMIC ABSORPTION QC

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

## 2.10 ICP/MS AND ICP SERIAL DILUTION

No serial dilution analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.11 INTERNAL STANDARDS PERFORMANCE

The ICP and ICP-MS internal standard recoveries for the site sample and associated QC sample analyses were within the 60-125% control limits and no qualifications were required.

## 2.12 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the sample in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. Analytes detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

## 2.13 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.13.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.13.2 Field Duplicates

There were no field duplicate analyses performed in association with the site sample.

NPDES Monitoring

ANALYSIS: PESTICIDES/PCBs

SAMPLE DELIVERY GROUP: IOA0121

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Pesticides/PCBs  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: February 16, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedures (DVP-4, Rev.2)*, *EPA Method 608*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the summary form as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory on ice within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ , at  $4^{\circ}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narrative noted that the sample was received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. The COC accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The water sample was extracted within seven days of sample collection and analyzed within 40 days of extraction. No qualifications were required.

### 2.2 PESTICIDES INSTRUMENT PERFORMANCE

No resolution check standards or breakdown check standards are required by Method 608 for pesticides, and according to the raw data provided, a resolution check standard was not analyzed by the laboratory. The laboratory did analyze a breakdown check standard with a breakdown of  $\leq 20\%$  for individual components (4,4-DDT and endrin) and  $\leq 30\%$  for the total, as suggested in the National Functional Guidelines. A review of the raw data indicated that the analytical run time was of sufficient length to provide adequate standard separation. The two analytical columns used in the analyses were within the guidelines specified in the methods.

According to the laboratory SOP and the initial calibration raw data, the retention time windows are  $\pm 0.10$  minutes for both surrogates and target compound calibration standards. A review of the raw data indicated that the laboratory retention time criteria were met for the surrogates and pesticide calibration standards. No qualifications were required.

### 2.3 CALIBRATION

#### 2.3.1 Analytical Sequence

Based on the data provided, the analytical sequences were in accordance with the requirements of Method 608. No qualifications were required.

### 2.3.2 Initial Calibration

There was one initial calibration dated 10/26/04 associated with pesticide analysis of sample Outfall 011, which consisted of six point calibrations for all pesticide target compounds on two analytical columns. The %RSDs were within the EPA Method 608 QC limit of  $\leq 10\%$  or  $r^2 \geq 0.995$  on both analytical columns. There was one initial calibration dated 01/04/05 associated with the PCB analysis of the sample. The PCB calibration consisted of five points for Arochlor 1016 and Arochlor 1260. Single point calibrations for Arochlor 1242, Arochlor 1248, and Arochlor 1254 were analyzed but were not provided in the data package. The average %RSDs for the individual peaks of Arochlor 1016 and Arochlor 1260 were  $\leq 10\%$  on both analytical columns. An ICV was analyzed immediately following each of the initial calibrations. The %Ds for all target compounds were within the QC limits of 15% on both analytical columns. A representative number of %RSDs and ICV %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.3.3 Continuing Calibration

The pesticide sample analysis of this SDG was bracketed by four continuing calibrations. In one of the bracketing calibrations following the sample analysis several %Ds exceeded 15% on channel A with high responses; however, as all results in this SDG were reported from channel B, no qualifications were assigned. The %Ds were within the Method QC limit of  $\pm 15\%$  for the remaining calibrations. The PCB analysis of this sample was bracketed by two CCVs and the %Ds for Arochlor 1016 and Arochlor 1260 were  $\leq 15\%$ . A representative number of %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.4 BLANKS

### 2.4.1 Instrument Blanks

An instrument blank was analyzed at the beginning of the analytical sequence. Cross-contamination was not evident in the sample. No qualifications were necessary.

### 2.4.2 Method Blanks

One water method blank (5A05041-BLK1) was extracted and analyzed with this SDG. There were no pesticide target compounds or Aroclors detected in the method blank. Review of the chromatograms showed no false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One blank spike/blank spike duplicate pair (5A05041-BS2/BSD2) was extracted and analyzed with this SDG. The recoveries for all spiked pesticide target compounds and Aroclors were within the laboratory-established QC limits and the RPDs were  $\leq 30\%$ . A representative number of recoveries were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample and all QC samples were fortified with the surrogate compounds decachlorobiphenyl and tetrachloro-m-xylene. Surrogate recoveries for this SDG were within the laboratory-established QC limits. The recoveries were calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

There were no MS/MSD analyses associated with this SDG. Method accuracy and precision were assessed based on the blank spike/blank spike duplicate results. No qualifications were required.

## 2.8 SAMPLE CLEANUP PERFORMANCE

According to the laboratory extraction benchsheets, no cleanups were performed on the water sample. No qualifications were required.

## 2.9 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Field Blanks and Equipment Rinsates

There were no field QC samples associated with the sample in this SDG. No qualifications were required.

### 2.9.2 Field Duplicates

There were no field duplicate samples associated with the samples in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for pesticide target compounds and PCBs by EPA Method 608. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for the sample in this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified for this SDG however, as there were no detects reported in this SDG, quantitation was verified by recalculating a representative number of blank spike and surrogate recoveries. Reporting limits were supported by the low level standard of the

DATA VALIDATION REPORT

Project: NPDES  
SDG: IOA0121  
Analysis: Pest/PCB

initial calibration and the laboratory MDL study. The water reporting limits were not adjusted for sample amount on the result summary; however, the dilution listed on the summary reflected the sample volume extracted. Results were reported in  $\mu\text{g/L}$  (ppb). No qualifications were required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available. *
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0115, IOA0121, IOA0131  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 4  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: March 03, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . No temperature information was provided by Eberline, the subcontract laboratory; however, as it is not necessary to chill radiological samples, no qualifications were required. All samples were intact and in good condition.

According to the Eberline login sheet, none of the samples were received preserved. It was confirmed in correspondence with Eberline dated 01/31/05, that the gross alpha, gross beta, and strontium samples were not preserved upon receipt. According to the Los Angeles Water Quality Control Board (LARWQCB) guidance letter dated 01/12/05, unfiltered samples should not be preserved and filtered aliquots should be preserved after filtration. As the strontium aliquot for Outfall 003 Filtered was not preserved; the nondetect strontium result was qualified as estimated, "UJ." Additionally, according to the 01/12/05 LARWQCB guidance letter, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. As none of the tritium samples were submitted on glass containers, all nondetect tritium results were qualified as estimated, "UJ." No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories. The original COCs for Outfall 003 did not request that an aliquot of each sample be filtered; however, the Del Mar project manager confirmed in a telephone conversation dated 1/31/05, that this was required by MWH. The original COC for Outfall 011 (SDG IOA0121) did not request that the sample containers received be analyzed for radionuclides. A memo from MWH personnel dated 2/17/05 requested these analyses. The transfer COCs accounted for all samples. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. No qualifications were required.

#### 2.1.3 Holding Times

The tritium and strontium samples were analyzed within 180 days of collection. The gross alpha and gross beta samples were analyzed beyond the five day holding time for unpreserved samples; therefore, the gross alpha and gross beta results were qualified as estimated, "J," for detects and, "UJ," for nondetects. No qualifications were necessary.

### 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha

The initial calibration included with the data was performed in February 2003. All detector efficiencies were below 20%; therefore, the nondetected alpha results were qualified as estimated, "UJ," for nondetects and "J," for detects.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable.

### Gross Beta and Strontium-90

The initial calibrations were performed in June 1997. All detector efficiencies were at least 20% and were considered acceptable. All continuing calibration results were within the laboratory control limits; therefore, no qualifications were necessary.

## **2.3 BLANKS**

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

One blank spike (8147-002) was analyzed in association with the samples in these SDGs. All recoveries were within both 3-sigma limits and the laboratory control limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed a duplicate analysis on Outfall 011 Composite. The RPDs for gross beta, tritium, and strontium were  $\leq 20\%$ . The RPD for gross alpha was  $>20\%$ ; however, as the results were within the 3 sigma limit, no qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

The laboratory performed matrix spike analyses on Outfall 011 Composite for gross alpha, gross beta and tritium. The recoveries were within both 3-sigma limits and the laboratory control limits. No qualifications were necessary.

## **2.7 SAMPLE RESULT VERIFICATION**

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted. No qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs:

# DATA VALIDATION REPORT

NPDES Monitoring

ANALYSIS: SEMIVOLATILES

SAMPLE DELIVERY GROUP: IOA0121

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## I. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Semivolatiles  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: M. Pokorny  
Date of Review: February 14, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Semivolatile Organics (DVP-3, Rev. 2)*, *EPA Method 625*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Outfall 011	Outfall 011	IOA0121-01	water	625

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The sample in this SDG was received at the laboratory within the temperature limits of 4°C ±2°C, at 5°C. The analysis did not require preservation, and no preservation was noted in the field. The COC noted that the sample was received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. The COC accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The water sample was extracted within seven days of collection and analyzed within 40 days of collection. No qualifications were required.

### 2.2 GC/MS TUNING

The DFTPP tunes met the criteria specified in Method 625, and the sample was analyzed within 12 hours of the DFTPP injection time. No qualifications were required.

### 2.3 CALIBRATION

The initial calibration associated with this SDG was dated 01/12/05. The average RRFs for were  $\geq 0.05$  and the %RSDs were  $\leq 35\%$  or  $r^2 \geq 0.995$  for all target compounds. A representative number of average RRFs and %RSDs were checked from the raw data, and no calculation or transcription errors were noted. The continuing calibration associated with the sample analysis was analyzed 01/13/05. The RRFs for all target compounds were  $\geq 0.05$ , and the %Ds were  $\leq 20$ . A representative number of RRFs and %Ds were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

### 2.4 BLANKS

One method blank (5A03039-BLK1) was extracted and analyzed with this SDG. There were no reportable detects for the target compounds listed on the summary form. Review of the raw data indicated no reportable false negatives. No qualifications were required.

### 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One blank spike/ blank spike duplicate pair (5A03039-BS1/BSD1) was extracted and analyzed with this SDG. For blank spike/blank spike duplicate pairs, qualifications are applied, if necessary,

to the associated samples based on those recoveries consistently outside of the laboratory-established QC limits in both the blank spike and blank spike duplicate. Results for those compounds with recoveries not consistent within the pair, with RPDs above the QC limit, are qualified as estimated, "UJ" for nondetects and "J" for detects, in the associated samples. All percent recoveries and RPDs were within the laboratory QC limits except for the recoveries of less than 10% for benzidine in both the LCS and LCSD and the recovery above the QC limit for 2,4-dinitrophenol in the LCSD only. Benzidine was rejected, "R," in the sample of this SDG. The RPD for hexachlorocyclopentadiene was above the QC limit and was qualified as an estimated nondetect, "UJ," in the sample of this SDG. A representative number of recoveries and RPDs were calculated from the raw data and no calculation or transcription errors were found. No further qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample surrogate recoveries were within the laboratory QC limits. A representative number of recoveries were calculated from the raw data, and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MS/MSD analyses were associated with this SDG. Evaluation of method accuracy and precision was based on blank spike/blank spike duplicate results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

### 2.8.1 Field Blanks and Equipment Rinsates

There were no field QC samples associated with this SDG. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples associated with this SDG.

## 2.9 INTERNAL STANDARDS PERFORMANCE

The internal standard area counts and retention times were within the control limits established by the continuing calibration standards: -50%/+100% for internal standard areas and  $\pm 30$  seconds for retention times. A representative number of recoveries were checked from the raw data, and no transcription or calculation errors were noted. No qualifications were required.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for five semivolatile target compounds by EPA Method 625. Review of the sample chromatogram, retention times, and spectra indicated no problems with target compound identification. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. No calculation or transcription errors were found. The reporting limits were supported by the low level of the initial and the method detection limit study. Detects below the reporting limit were qualified as estimated, "J," by the laboratory. No further qualifications were required.

## 2.12 TENTATIVELY IDENTIFIED COMPOUNDS

TICs were not reported by the laboratory for this SDG. No qualifications were required.

## 2.13 SYSTEM PERFORMANCE

Review of the raw data indicated no problems with system performance. No qualifications were required.

NPDES Monitoring

ANALYSIS: Total Petroleum Hydrocarbons: Extractable

SAMPLE DELIVERY GROUP: IOA0121

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: TPH-Extractable  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: February 14, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Extractable Total Fuel Hydrocarbons by GC (DVP-8, Rev. 2)*, USEPA SW-846 Method 8015M, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical laboratory on ice within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ , at  $4^{\circ}\text{C}$ . The Del Mar Analytical case narrative noted that the sample containers were received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel, and accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. The TPH-Extractable analysis was not requested on the COC; however, a COC analytical request change form dated 02/16/05 clarified the requested analyses. No qualifications were required.

#### 2.1.3 Holding Times

The sample was extracted within seven days of sample collection and analyzed within 40 days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The initial calibration associated with the sample analysis was analyzed on 12/22/04. The %RSD was within the QC limit of  $\leq 20\%$ . The %Ds for the initial calibration verification (ICV) and continuing calibrations associated with the sample analysis were  $\leq 15\%$ . The %RSD and %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.4 METHOD BLANKS

One method blank (5A06045-BLK1) was extracted and analyzed with the sample in this SDG. EFH (C13-C22) was not present above the MDL in the method blank or in the instrument blank analyzed at the beginning of the analytical sequence. Review of the chromatograms showed no false negatives. No qualifications were required.

### 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One method blank spike/blank spike duplicate pair (5A06045-BS1/BSD1) was extracted and analyzed with the sample in this SDG. The recoveries of alkane range C13-C40 from spiked diesel were within the laboratory-established QC limits of 40-120%, and the RPD was within the QC limit

of  $\leq 25\%$ . The recoveries and RPD were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample was fortified with the surrogate compound n-octacosane. The sample surrogate recovery was within the laboratory-established QC of 40-125%. The recovery was calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

There were no MS/MSD analyses associated with the sample of this SDG. Evaluation of method accuracy and precision was based on the BS/BSD results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Field Blanks and Equipment Rinsates

There were no field blank or equipment rinsate samples associated with the site sample in this SDG. No qualifications were required.

### 2.9.2 Field Duplicates

There were no field duplicate samples associated with the samples in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for EFH n-alkane range C13-C22 by EPA SW846 Method 8015M. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified for this SDG by recalculating any sample detect, blank spike recoveries, and a representative number of surrogate recoveries. Reporting limits were supported by the low level standard of the initial calibration and by the laboratory MDL. No qualifications were required.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in this SDG were received at Del Mar Analytical laboratory on ice within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ , at  $4^{\circ}\text{C}$ . The Del Mar Analytical case narrative noted that the samples were received intact, and the COC indicated the samples were properly preserved. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. As the samples were couriered directly to the laboratory, custody seals were not required. The TPH-GRO analysis was not requested on the COC; however, a COC analytical request change form dated 02/16/05 clarified the requested analyses. No qualifications were required.

#### 2.1.3 Holding Times

The water samples were analyzed within 14 days of collection. No qualifications were required.

### 2.2 CALIBRATION

One gasoline standard initial calibration dated 08/26/04 was associated with the sample analyses. The %RSD for GRO (C4-C12) was within the QC limit of  $\leq 20\%$ . An initial calibration verification (ICV) was not provided in the data package. The %Ds for both CCVs bracketing the sample analyses were within the Method QC limit of  $\leq 15\%$ . The %RSD and %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.4 METHOD BLANKS

One water method blank (5A06001-BLK1) was associated with the sample analyses. GRO (C4-C12) was not detected above the MDL in the method blank. Review of the raw data indicated no false negative result. No qualifications were necessary.

### 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One water method blank spike (5A06001-BS1) was associated with the sample analyses. GRO (C4-C12) was recovered within the laboratory-established QC limits of 70-140% in the blank spike. The recovery was checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The samples were fortified with the surrogate compound bromofluorobenzene (BFB). Surrogate recoveries were within the laboratory-established QC of 65-140% for both samples. Recoveries were calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were not performed on the sample in this SDG; therefore, evaluation of method accuracy was based on the blank spike results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Trip Blanks, Field Blanks, and Equipment Rinsates

Sample Trip Blank was the trip blank associated with site sample Outfall 011. GRO (C4-C12) was not detected above the MDL in the trip blank. Review of the raw data indicated no false negative result. There were no field blank or equipment rinsate samples associated with this SDG. No qualifications were necessary.

### 2.9.2 Field Duplicates

There were no field duplicate samples in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for GRO (C4-C12) by EPA SW-846 Method 8015M. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for the samples in this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified for this SDG by recalculating any sample detects, blank spike recoveries, and a representative number of surrogate recoveries. Reporting limits were supported by the low level standard of the initial calibrations and by the laboratory MDL. No qualifications were required.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the Del Mar within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The sample was properly preserved. The COC noted that the sample was received intact; however, information regarding absence of headspace was not provided. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed by field and laboratory personnel. The COCs accounted for the analysis presented in this SDG. According to the sample login sheet, custody seals were not present on the cooler. No qualifications were required.

#### 2.1.3 Holding Times

The sample was analyzed within 14 days of collection. No qualifications were required.

### 2.2 GC/MS TUNING

The ion abundance windows were consistent with those specified in EPA Method 8260B. All ion abundances were within the established windows, and the sample was analyzed within 12 hours of the BFB injection time. No qualifications were required.

### 2.3 CALIBRATION

One initial calibration, dated 01/07/04, was associated with this SDG. The average RRF for 1,4-dioxane was  $\geq 0.05$  and the %RSD was  $\leq 15\%$ . One continuing calibration, dated 01/07/05 was associated with this SDG. The RRF for 1,4-dioxane was  $\geq 0.05$  and the %D was  $\leq 20\%$ . The %RSD and average RRF for 1,4-dioxane in the initial calibration, and the %D and RRF for 1,4-dioxane in the continuing calibration were recalculated from the raw data, and no calculation or transcription errors were found. No qualifications were required.

### 2.4 BLANKS

One water method blank (P5A1203-BLK1) was associated with this SDG. Target compound 1,4-dioxane was not detected in the method blank. The method blank raw data showed no evidence of a false negative. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The laboratory analyzed a blank spike/blank spike duplicate pair (P5A1203-BS1/BS1D) with this SDG. The recoveries and RPD for 1,4-dioxane were within the laboratory QC limits. A representative recovery was recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample and QC were fortified with dibromofluoromethane. The surrogate was recovered within the laboratory QC limits of 80-125%. The surrogate recovery for this sample was recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

Sample Outfall 011 was the MS/MSD analyses performed with this SDG. The recoveries and RPD for 1,4-dioxane were within the laboratory QC limits. A representative recovery was recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site sample. Following are findings associated with field QC samples:

### 2.8.1 Trip Blanks

The sample in this SDG had no associated trip blank. No qualifications were required.

### 2.8.1 Field Blanks and Equipment Rinsates

The site sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples associated with this SDG.

## 2.9 INTERNAL STANDARDS PERFORMANCE

Internal standard area counts and retention times for the sample were within the control limits established by the continuing calibration standards, of +100%/-50% for internal standard areas and  $\pm 0.50$  minutes for retention times. Internal standard areas and retention times were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.10 COMPOUND IDENTIFICATION

Target compound identification was verified at a Level IV data validation. The laboratory analyzed for 1,4-dioxane by Method 8260B/SIM. Chromatograms, retention times, and spectra for the sample and QC were examined and no target compound identification problems were noted. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. The reporting limit was supported by the lowest concentration of the initial calibration standards and by the undated MDL supplied by the laboratory. Compound quantitation was verified by recalculating blank spike and surrogate recoveries from the raw data. No calculation or transcription errors were noted. No qualifications were required.

## 2.12 TENTATIVELY IDENTIFIED COMPOUNDS

TICs are not typically reported for SIM methods.

## 2.13 SYSTEM PERFORMANCE

A review of the chromatograms and other raw data showed no identifiable problems with system performance. No qualifications were required.

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Volatiles  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: M. Pokorny  
Date of Review: February 11, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Volatile Organics (DVP-2, Rev. 2)*, *EPA Method 624*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the summary forms as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Lab No.	Matrix	Method
Outfall 011	Outfall 011	IOA0121-01	water	624
Trip Blank	Trip Blank	IOA0121-02	water	624

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in this SDG were received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . According to the COC, the samples were received intact, without headspace, and in good condition. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed by field and laboratory personnel and accounted for the analyses presented in this SDG. As the samples were couriered directly to the laboratory, custody seals are not required. No qualifications were required.

#### 2.1.3 Holding Times

The samples were analyzed within 14 days of collection. No qualifications were required.

### 2.2 GC/MS TUNING

The ion abundance windows shown on the quantitation report were consistent with those specified in the EPA Method 624. All ion abundances were within the established windows and were therefore acceptable. The samples and associated QC were analyzed within 12 hours of the BFB injection times. The Form Vs were verified from the raw data and no discrepancies between the summary forms and the raw data were noted. No qualifications were required.

### 2.3 CALIBRATION

Two initial calibrations, dated 10/24/04 and 11/10/04, were associated with this SDG. The average RRFs were  $\geq 0.05$  and the %RSDs were  $\leq 35\%$  for the target compounds listed on the sample summary forms. Two continuing calibrations, dated 01/05/05 (16:00 and 16:33), were associated with this SDG. The RRFs for all target compounds were  $\geq 0.05$  and the %Ds were  $\leq 20\%$  except for the %Ds for methylene chloride, 2-chloroethylvinyl ether, bromoform, acrolein, and acrylonitrile. The aforementioned compounds were qualified as estimated nondetects, "UJ," in the site sample of this SDG. A representative number of %RSDs and average RRFs from the initial calibrations, and %Ds and RRFs from the continuing calibrations were recalculated from the raw data, and no calculation or transcription errors were found. No further qualifications were required.

## 2.4 BLANKS

Two water method blank (5A05017-BLK1 and 5A05012) were associated with this SDG. There were no detects for the target compounds listed on the summary forms. The method blank raw data showed no evidence of false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Two water blank spikes (5A05017-BS1 and 5A05012) were associated with this SDG. All spike recoveries were within the laboratory-established QC limits. A representative number of recoveries were recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The surrogates were within the QC limits of 80-120%. A representative number of surrogate recoveries were recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

An MS/MSD analyses was not performed with this SDG. Evaluation of method accuracy was based on the LCS results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site sample. Following are findings associated with field QC samples:

### 2.8.1 Trip Blanks

Sample Trip Blank (IOA0121-02) was the trip blank associated with the site sample of this SDG. Methylene chloride was detected in the trip blank; however, the sample of this SDG did not have any target compounds detected. No qualifications were required.

### 2.8.2 Field Blanks and Equipment Rinsates

There were no other field QC samples associated with this SDG. No qualifications were required.

### 2.8.3 Field Duplicates

There were no field duplicate samples associated with this SDG.

## 2.9 INTERNAL STANDARDS PERFORMANCE

Internal standard area counts and retention times for this SDG were within the control limits established by the continuing calibration standards, of +100%/-50% for internal standard areas and  $\pm 0.50$  minutes for retention times. A representative number of internal standard areas and retention times were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.10 COMPOUND IDENTIFICATION

Target compound identification was verified at a Level IV data validation. The laboratory analyzed for a subset of volatile target compounds by EPA Method 624. Chromatograms, retention times, and spectra for the samples and QC were examined and no target compound identification problems were noted.

The laboratory analyzed for 1,2-dichloro-1,1,2-trifluorethane and cyclohexane as TICs for this SDG. 1,2-dichloro-1,1,2-trifluorethane was present in the calibration standards. Neither compound was reported either as a TIC or as a target compound in the samples of this SDG and were reported as estimated nondetects, "UJ."

No further qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. The reporting limits were supported by the lowest concentrations of the initial calibration standards and by MDL study. Compound quantitation was verified by recalculating any sample detect, and/or a representative number of blank spike and surrogate recoveries from the raw data. No calculation or transcription errors were noted. No qualifications were required.

## 2.12 TENTATIVELY IDENTIFIED COMPOUNDS

The laboratory analyzed for 1,2-dichloro-1,1,2-trifluorethane and cyclohexane as TICs for this SDG. 1,2-dichloro-1,1,2-trifluorethane was present in the calibration standards. Neither compound was reported either as a TIC or as a target compound in the samples of this SDG. No qualifications were required.

## 2.13 SYSTEM PERFORMANCE

A review of the chromatograms and other raw data showed no identifiable problems with system performance. No qualifications were required.

## NPDES Monitoring

ANALYSIS: GENERAL MINERALS

SAMPLE DELIVERY GROUP: IOA0121

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: General Minerals  
QC Level: Level IV  
No. of Samples: 1  
Reviewer: P. Meeks  
Date of Review: February 14, 2005

The sample listed in Table 1 was validated based on the guidelines outlined in the AMEC *Data Validation Procedures SOP DVP-6, Rev. 2, USEPA Methods for Chemical Analysis of Water and Wastes Method 300.0, 350.2, 330.5, 405.1, 335.2, 413.1, 415.1, 418.1, 425.1, 218.6, 120.1, 160.2, 160.5, 180.1, 150.1, and 120.1, Standard Methods for the Examination of Water and Wastewater Method SM5540-C and SM2540C*, and validation guidelines outlined in the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No preservation problems were noted by the laboratory. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel. The COC requested only a few of the presented analyses. The remaining analyses were requested in a memo from MWH personnel dated 02/16/05. No sample qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analyses. The 28-day analytical holding time for ammonia, fluoride, chloride, sulfate, conductivity, total recoverable hydrocarbons, TOC, and oil and grease, the 14-day analytical holding time for cyanide, the seven-day holding time for total suspended solids and total dissolved solids, the 48-hour holding time for biological oxygen demand, surfactants, turbidity, nitrate/nitrite, and total settleable solids, and the 24-hour residual chlorine holding time were met. The 24-hour hexavalent chromium holding time was exceeded; therefore, nondetected hexavalent chromium in Outfall 011 Grab was qualified as estimated, "UJ." No further qualifications were required.

### 2.2 CALIBRATION

For the applicable analyses, the initial calibration correlation coefficients were  $\geq 0.995$ . All ICV and continuing calibration information was acceptable with %Rs within the control limits of 90-110%. For ammonia, no information regarding the standardization of the titrant was provided; however, as the LCS recovery was within the CCV control limits, no qualifications were required. For BOD, no information regarding the calibration of the oxygen meter was provided; however, as the LCS recovery was within the CCV control limits, no qualifications were required. Calibration is not applicable to residual chlorine or total settleable solids. No qualifications were required.

### 2.3 BLANKS

Hexavalent chromium was detected in the method blank at 0.15 mg/L and in the bracketing CCB at 0.20 mg/L; therefore, hexavalent chromium detected in Outfall 011 Grab was qualified as an estimated nondetect, "UJ." The remaining method blank and CCB results reported on the summary forms and in the

raw data for blank analyses associated with the sample were nondetects at the reporting limit. No further qualifications were required.

#### **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

The laboratory control sample and laboratory control sample duplicate (BOD and oil and grease only) recoveries were within the laboratory-established control limits. The LCS is not applicable to turbidity, conductivity, residual chlorine, or settleable solids. No qualifications were required.

#### **2.5 SURROGATES RECOVERY**

Surrogate recovery is not applicable to the analyses presented in this SDG.

#### **2.6 LABORATORY DUPLICATES**

A duplicate analysis was performed on Outfall 011 Grab for residual chlorine and MS/MSD analyses were performed for hexavalent chromium. Both RPDs were within the laboratory-established control limits. No qualifications were required.

#### **2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

MS/MSD analyses were performed on Outfall 011 Grab hexavalent chromium only. Both recoveries were within the laboratory-established control limits of 90-110% and no qualifications were required.

#### **2.8 FURNACE ATOMIC ABSORPTION QC**

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

#### **2.9 ICP SERIAL DILUTION**

ICP serial dilution is not applicable to the analysis presented in this data validation report.

#### **2.10 SAMPLE RESULT VERIFICATION**

A Level IV review was performed for the sample in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. MBAS was analyzed at a 100× dilution, as the sample had formed an

DATA VALIDATION REPORT

Project: NPDES  
SDG No.: IOA0121  
Analysis: Gen. Min.

emulsion. Analytes detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

**2.11 FIELD QC SAMPLES**

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

**2.11.1 Field Blanks and Equipment Rinsates**

The sample in this SDG had no associated field QC samples. No qualifications were required.

**2.11.2 Field Duplicates**

There were no field duplicate pairs associated with this SDG.

**CONTRACT COMPLIANCE SCREENING FORM FOR HARDCOPY DATA**

AMEC Earth & Environmental  
 550 South Wadsworth Boulevard  
 Suite 500  
 Lakewood, CO 80226

Package ID T711WC60  
 Task Order 313150010  
 SDG No. IOA0121

No. of Analyses 1

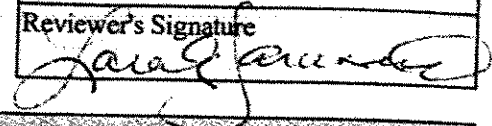

Laboratory Del Mar Analytical

Reviewer L. Jarusewic

Analysis/Method Perchlorate

Date: 02/11/05

Reviewer's Signature

**ACTION ITEMS<sup>a</sup>**

1. Case Narrative Deficiencies
2. Out of Scope Analyses
3. Analyses Not Conducted
4. Missing Hardcopy Deliverables
5. Incorrect Hardcopy Deliverables
6. Deviations from Analysis Protocol, e.g.,
  - Holding Times
  - GC/MS Tune/Inst. Performance
  - Calibrations
  - Blanks
  - Surrogates
  - Matrix Spike/Dup LCS
  - Field QC
  - Internal Standard Performance
  - Compound Identification and Quantitation
  - System Performance

**COMMENTS<sup>b</sup>**

Acceptable as reviewed.

<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements.

<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

# DATA VALIDATION REPORT

NPDES Monitoring

ANALYSIS: PERCHLORATE

SAMPLE DELIVERY GROUP: IOA0121

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## I. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0121  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Perchlorate  
QC Level: Level IV  
No. of Samples: 1  
Reviewer: L. Jarusewic  
Date of Review: February 11, 2005

The sample listed in Table 1 was validated based on the guidelines outlined in the AMEC *Data Validation Procedures SOP DVP-6, Rev. 2, USEPA Methods for Chemical Analysis of Water and Wastes Method 314.0, and 120.1*, and validation guidelines outlined in the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Outfall 011	Outfall 011	IOA0121-01	water	Perchlorate

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No preservation problems were noted by the laboratory. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel, and accounted for the sample and analysis presented in this SDG. No qualifications were required.

#### 2.1.3 Holding Times

The holding time was assessed by comparing the date of collection with the date of analysis. The 28-day analytical holding time for perchlorate was met, and no qualifications were required.

### 2.2 CALIBRATION

The initial calibration correlation coefficient was  $\geq 0.995$ . The IPC-MA recovery was within the control limits of 80-120%. The ICV and IPC recoveries were within the control limits of 90-110%. The CCV recovery was above the control limits of 90-110%; however, as perchlorate was not detected in the site sample, no qualifications were required.

### 2.3 BLANKS

The method blank and CCB results reported on the summary forms and in the raw data for blank analyses associated with the sample were nondetects at the reporting limit. No qualifications were required.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The laboratory control sample recovery was within the method control limits of 85-115%. No qualifications were required.

### 2.5 SURROGATES RECOVERY

Surrogate recovery is not applicable to the analysis presented in this SDG.

## 2.6 LABORATORY DUPLICATES

No MS/MSD or duplicate analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MS/MSD analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.8 FURNACE ATOMIC ABSORPTION QC

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

## 2.9 ICP SERIAL DILUTION

ICP serial dilution is not applicable to the analysis presented in this data validation report.

## 2.10 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the sample in this data package. Calculations were verified, and the sample result reported on the Form I was verified against the raw data. No transcription errors or calculations errors were noted. No qualifications were required.

## 2.11 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.11.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.11.2 Field Duplicates

There were no field duplicate pairs associated with this package.

Del Mar Analytical Laboratory Report

LABORATORY REPORT

Prepared For: MWH-Pasadena/Boeing  
300 North Lake Avenue, Suite 1200  
Pasadena, CA 91101  
Attention: Bronwyn Kelly

Project: Routine Outfall 011 - Grab

Sampled: 01/11/05  
Received: 01/11/05  
Issued: 03/09/05 19:48

NELAP #01108CA California ELAP#1197 CSDLAC #10117

*The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain(s) of Custody, 6 pages, are included and are an integral part of this report.  
This entire report was reviewed and approved for release.*

Sampled: 01/11/05  
Received: 01/11/05

### CORRECTIVE ACTION REPORT

Department: Extractions

Date: 01/18/2005

Method: EPA 625

Matrix: Water

QC Batch: 5A12027

#### Identification and Definition of Problem:

- 1) The percent recoveries for 3,3-dichlorobenzidine, 4-chloroaniline, benzidine, and hexachlorobutadiene in the LCS and/or LCSD were below method acceptance limits.
- 2) The RPD between the LCS and LCSD exceeded method acceptance limits for 2-methylnaphthalene, 3,3-dichlorobenzidine, 4-chloroaniline, aniline, naphthalene.

#### Determination of the Cause of the Problem:

Benzidine is known to be a problematic compound. According to the EPA, it can be subject to oxidative losses during solvent extraction and its chromatographic behavior is poor. A definitive cause for the other QC failures has not been determined.

#### Corrective Action Taken:

All results reported for 3,3-dichlorobenzidine, 4-chloroaniline, benzidine, and hexachlorobutadiene are potentially biased low and can be considered estimates only. No acceptable precision data could be reported for 2-methylnaphthalene, 3,3-dichlorobenzidine, 4-chloroaniline, aniline, and naphthalene. Samples could not be reextracted within the method-specified holding time.

Quality Assurance Approval:

Dave Dawes

Received: 01/11/05

**DATA QUALIFIERS AND DEFINITIONS**

- B** Analyte was detected in the associated Method Blank.
- C** Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of unknown quality.
- L** Laboratory Control Sample recovery was above the method control limits. Analyte not detected, data not impacted.
- L2** Laboratory Control Sample recovery was below method control limits.
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- P1** Sample received and analyzed without chemical preservation.
- R-2** The RPD exceeded the method control limit.
- R-7** LFB/LFBD RPD exceeded the method control limit. Recovery met acceptance criteria.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

**ADDITIONAL COMMENTS**

**For TICs:**

All identifications are tentative and concentrations are estimates based upon spectral comparison to the EPA/NIH library.

**For 1,2-Diphenylhydrazine:**

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

**For GRO (C4-C12):**

GRO (C4-C12) is quantitated against a gasoline standard. Quantitation begins immediately following the methanol peak.

**For Extractable Fuel Hydrocarbons (EFH, DRO, ORO) :**

Unless otherwise noted, Extractable Fuel Hydrocarbons (EFH, DRO, ORO) are quantitated against a Diesel Fuel Standard.

Subject: Chain-of-Custody Form Analytical Request Change      No. of Pages: 1  
(including cover)

**Per Request:**

Please make the changes listed below to the chain-of-custody analytical request form. Include this form with the final deliverables for these samples.

Del Mar Work Order #	Sample ID	Date Collected	Change(s) Requested, Not Completed	Change(s) and Method (s) Now Requested
IOA0567	Outfall 011 – Composite	01/11/05		NH3, BOD, Cl-, N/N-N, Oil and Grease, Sulfate, MBAS, TDS, TSS, Settleable Solids, Turbidity, CN, Clo4-, Conductivity, Lead, Cr, Cu, Hg, TOC, TCDD.
IOA0549	Outfall 011 – Grab	01/11/05		608 Pest/PCB-PP list, 625-PP list, Sb, As, Ba, Be, B, Cd, Cr, Co, F, Fe, Mn, Ni, Se, Ag, Tl, V, Zn, 1,4-Dioxane, 624-Freon 113, Freon 123a, Cyclohexane
IOB1004	Outfall 011 – Composite	01/11/05		NH3, BOD, Cl-, N/N-N, Oil and Grease, Sulfate, MBAS, TDS, TSS, Settleable Solids, Turbidity, CN, Clo4-, Conductivity, Lead, Cr, Cu, Hg, TOC, TCDD.

The reason for these changes:

*Incorrectly marked on COC form* \_\_\_\_\_

*Lack of sample volume* \_\_\_\_\_

*MWH office personnel require this change* \_\_\_\_\_ X \_\_\_\_\_

*Other: Containers mislabeled* \_\_\_\_\_

This Change Order supersedes all previous change orders submitted.

Thank you

Attention: Bronwyn Kelly  
 Project: 13267 (Study 1)  
 Outfall 011 Grab  
 Sampled: 1/11/05  
 Del Mar Analytical Number: IOA0549

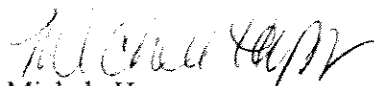

Dear Ms. Kelly:

Aquatic Testing Laboratories performed the Fathead Minnow 96hr Percent Survival Bioassay by EPA Method 2000.0 and Ceriodaphnia Survival and Reproduction Test by EPA Method 1002, Eberline Services performed Gross Alpha/Gross Beta (EPA 900.0), Tritium (H-3, EPA 906.0), and Strontium-90 (Sr-90, EPA 905.0), Pace Analytical performed the TCDD analysis by USEPA Method 1613B, and Truesdail Laboratories performed the Hydrazines by EPA 8315B for the project referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	ATL ID	EBERLINE ID	PACE ID	TRUESDAIL ID
Outfall 011-Grab	IOA0549-01	A-05011205-001/002	R501122/8175-001	106132001	938566-1

Attached is the original report from the subcontract laboratory. If you have any questions or require further assistance, please do not hesitate to contact me.

Sincerely yours,  
 DEL MAR ANALYTICAL

  
 Michele Harper  
 Project Manager

# LABORATORY REPORT

*"dedicated to providing quality aquatic toxicity testing"*

# FATHEAD MINNOW PERCENT SURVIVAL TEST

Lab No.: A-05011205-001  
 Client/ID: Del Mar IOA0549-01

Start Date: 01/12/2005

## TEST SUMMARY

Species: *Pimephales promelas*.  
 Age: 13 (1-14) days.  
 Regulations: NPDES.  
 Test solution volume: 250 ml.  
 Feeding: prior to renewal at 48 hrs.  
 Number of replicates: 2.  
 Dilution water: Moderately hard reconstituted water.  
 Photoperiod: 16/8 hrs light/dark.

Source: In-laboratory Culture.  
 Test type: Static-Renewal.  
 Test Protocol: EPA-821-R-02-012.  
 Endpoints: Percent Survival at 96 hrs.  
 Test chamber: 600 ml beakers.  
 Temperature: 20 +/- 1°C.  
 Number of fish per chamber: 10.  
 QA/QC Batch No.: RT-050104.

### Comments:

Sample as received: Chlorine: 0 mg/l; pH: 6.9; Conductivity: 78 umho; Temp: 4°C;  
 DO: 9.8 mg/l; Alkalinity: 24 mg/l; Hardness: 32 mg/l; NH<sub>3</sub>-N: 0.4 mg/l.  
 Sample aerated moderately (approx. 500 ml/min) to raise or lower DO? Yes / No  
 Control: Alkalinity: 60 mg/l; Hardness: 100 mg/l; Conductivity: 315 umho.  
 Test solution aerated (not to exceed 100 bubbles/min) to maintain DO > 4.0 mg/l? Yes / No.  
 Sample used for renewal is the original sample kept at 0-6°C with minimal headspace.

## RESULTS

Percent Survival In: Control: 100 %    100% Sample: 100 %

**CERIODAPHNIA CHRONIC BIOASSAY  
EPA METHOD 1002.0**

Lab No.: A-05011205  
Client/ID: Del Mar IOA0549-01

Date Tested: 01/12/05 to 01/18/05

**TEST SUMMARY**

Test type: Daily static-renewal.  
Species: *Ceriodaphnia dubia*.  
Age: < 24 hrs; all released within 8 hrs.  
Test vessel size: 30 ml.  
Number of test organisms per vessel: 1.  
Temperature: 25 +/- 1°C.  
Dilution water: Mod. hard reconstituted (MHRW).  
QA/QC Batch No.: RT-050104.

Endpoints: Survival and Reproduction.  
Source: In-laboratory culture.  
Food: .1 ml YTC, algae per day.  
Test solution volume: 15 ml.  
Number of replicates: 10.  
Photoperiod: 16/8 hrs. light/dark cycle.  
Test duration: 7 days.  
Statistics: ToxCalc computer program.

**RESULTS SUMMARY**

Sample Concentration	Percent Survival	Mean Number of Young Per Female
Control	100%	23.0
6.25%	100%	24.0
12.5%	100%	29.1
25%	100%	30.3
50%	100%	30.5
100%	100%	30.7

\* Statistically significantly less than control at P = 0.05 level.  
\*\* Reproduction data from concentrations greater than survival NOEC are excluded from statistical analysis.

**CHRONIC TOXICITY**

Parameter	Survival	Growth
NOEC	100%	100%
TUc	1.0	1.0

**QA/QC TEST ACCEPTABILITY**

Parameter	Result
Control survival ≥ 80%	Pass (100% survival)
≥ 15 young per surviving control female	Pass (23.0 young)
≥ 60% surviving controls had 3 broods	Pass (70% with 3 broods)
PMSD < 47% for reproduction; if > 47% and no toxicity at IWC, the test must be repeated	Pass (PMSD = 25.4%)
Statistically significantly different concentrations relative difference > 13%	NA - No stat. sig. diff. concentrations
Concentration response relationship acceptable	Pass (slight inverse response at conc. tested)

Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R501122-8175

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on January 14, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

Irvine, CA 92614

**Attention:** Michele Harper

**Project Name:** IOA0549  
**Date Received:** 01/12/05

**Truesdail Project:** 938566

## Case Narrative

**Sample Receipt** The sample was received in good condition and no anomalies were noted during check-in. The sample was kept in a refrigerator until analysis. Thereafter, it is being kept in ambient storage for an additional 2 months before disposal.

**Analysis** The analysis was performed as requested on the chain-of-custody.

**Quality Control** The analytical results for each batch of samples performed include a minimum of one set of laboratory control sample/laboratory control sample duplicate (LCS/LCSD), one matrix spike (MS) and a reagent blank (Method blank). Any exceptions or problems would be noted in the "comments" section.

**Comments** The test results in this report meet all quality assurance requirements set forth by the method specification and all quality control recoveries were within the laboratory acceptance limits. No anomalies or nonconformance events occurred during the course of analysis.

On 1/24/05, client called to add a Level IV Data Package to the project. Since the request was made after the analysis was completed, the normal procedure for logging-in for Level IV was not followed. However, the data package for this project is completed as per the requirement.

# Sample Integrity & Analysis Discrepancy Form

Client: Del Mar Analytical

Lab # 935566

Date Delivered: 1/12/05 Time: 7:30 By:  Mail  Field Service  Client

1. Was a Chain of Custody received and signed?  Yes  No  N/A
2. Does Customer require an acknowledgement of the COC?  Yes  No  N/A
3. Are there any special requirements or notes on the COC?  Yes  No  N/A
4. If a letter was sent with the COC, does it match the COC?  Yes  No  N/A
5. Were all requested analyses understood and acceptable?  Yes  No  N/A
6. Were samples received in a chilled condition?  
Temperature (if yes)? 4°C  Yes  No  N/A
7. Were samples received intact  
(i.e. broken bottles, leaks, air bubbles, etc.)?  Yes  No  N/A
8. Were sample custody seals intact?  Yes  No  N/A
9. Does the number of samples received agree with COC?  Yes  No  N/A
10. Did sample labels correspond with the client ID's?  Yes  No  N/A
11. Did sample labels indicate proper preservation?  
Preserved by:  Truesdail  Client  Yes  No  N/A
12. Were samples pH checked? pH = NP  Yes  No  N/A
13. Were all analyses within holding time at time of receipt?  
If not, notify the Project Manager.  Yes  No  N/A
14. Have Project due dates been checked and accepted?  
Turn Around Time (TAT):  RUSH  Std  Yes  No  N/A
15. **Sample Matrix:**  Liquid  Drinking Water  Ground Water  Waste Water  
 Sludge  Soil  Wipe  Paint  Solid  Other water

Subject B/359 Area SW sampling

Bob,

There is rain/thunderstorm forecasted this weekend in Simi Valley. Please design a B/359 SW sampling plan and have a personnel standby to sample this weekend. I suggest a sight map with sampling location like we did last year.

This plan should be pretty similar to last seasons, except the collection pond at the NW corner of the B/359 area is gone. I believe that we need to continue to collect CLO4 samples at the NW corner of B/359 and near the palm tree down stream from it. Other samples including the one near the R1 pond should be put on hold.

Thanks,

David Chung

## 1. INTRODUCTION

Task Order Title: NPDES  
MEC<sup>X</sup> Project Number: 1261.001D.01  
Sample Delivery Group: IPB2637, IPB2639, IPB2641, IPB2643  
Project Manager: P. Costa  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 4  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: April 8, 2006

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	Truesdail Laboratory ID	Del Mar Laboratory ID	Matrix	COC Method

Outfall 011	952268	IPB2641-01	Water	8315
Outfall 018	952265	IPB2643-01	Water	8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for these SDGs noted that the samples were received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs from the field to Del Mar were signed and dated by field and laboratory personnel, and the transfer COCs from Del Mar to Truesdail Laboratories were signed and dated by personnel from both laboratories. The original COCs and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported and therefore, validated. Custody seals were not required as the samples were transported to Del Mar and then to Truesdail by courier. Truesdail Laboratories did not list the client IDs on the Form Is; therefore, the reviewer hand-corrected the Form Is to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analysis. The samples were extraction within the three-day holding time and analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibrations were analyzed 03/03/06, with correlation coefficients of  $\geq 0.995$  for all three hydrazines. The ICV and CCV bracketing the sample analyses had hydrazine recoveries within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with these SDGs. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate pair was analyzed with these SDGs. The hydrazine recoveries and RPDs were within the laboratory-established control limits. No qualifications were required.

### 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

### 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on Outfall 002. The hydrazines recoveries and RPDs were within the laboratory-established control limits. No qualifications were required.

### 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

#### 2.7.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC. No qualifications were required.

#### 2.7.2 Field Duplicates

There were no field duplicate samples in these SDGs.

## 2.8 COMPOUND IDENTIFICATION

The samples were analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Review of the sample chromatogram, retention times, and spectra indicated no problems with target compound identification. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. As there were no sample detects, compound quantification was verified from the raw data by recalculating LCS/LCSD and MS/MSD detects. No calculation or transcription error were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

### Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*\* Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: METALS

SAMPLE DELIVERY GROUPS: IOA0131

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0131  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Metals  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: K. Okonzak-Lowry  
Date of Review: February 15, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels III and IV ICP-MS Metals, (DVP-5-A, Rev.0)*, *AMEC Data Validation Procedure for Levels III and IV ICP Metals (DVP-5, Rev. 0)*, *SW-846 Method 6020B for Inductively Coupled Plasma – Mass Spectrometry*, *SW-846 Method 6010B for Inductively Coupled Plasma*, *SW-846 Method 7471A for Mercury (Manual Cold-Vapor Technique)*, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Client ID	EPA ID	Laboratory ID	Matrix	COC Method
Outfall 011	Outfall 011	IOA0131-01	water	ILM04

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No sample preservation, handling, or transport problems were noted, and no qualifications were necessary.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel. The COC requested only a few of the presented analytes. The remaining analytes were requested in a memo from MWH personnel dated 02/16/05. No sample qualifications were required.

#### 2.1.3 Holding Times

The date of collection recorded on the COC and the dates of analyses recorded in the raw data, documented that the sample analyses were performed within the specified holding times of six months for the ICP/MS and ICP metals and 28 days for mercury. No qualifications were required.

### 2.2 ICP-MS TUNING

A precalibration routine must be completed prior to calibrating the instrument, which consists of analyzing a tuning solution to verify resolution, mass calibration, and thermal stability. The solution must be analyzed a minimum of five times and must contain isotopes representing all mass regions of interest. The laboratory performed the required tune solution analyses but did not report %RSDs. The laboratory SOP states that to be acceptable, the %RSD must be less than 5%. The mass calibrations were within 0.1 amu of the true mass and the instrument resolutions were less than 0.75 amu at 5 percent peak height for all analytes in the tune solution. No site sample qualifications were required.

### 2.3 CALIBRATION

The ICV and CCV results showed acceptable recoveries, 90-110% for ICP and ICP/MS and 80-120% for mercury. The applicable reporting limit check standards were recovered within the AMEC control limits of 70-130%. No sample qualifications were required.

## 2.4 BLANKS

There were detects and negative results reported for the method blanks and bracketing ICBs/CCBs associated with the sample in this SDG. Arsenic and silver were detected in a bracketing CCB at 0.63305 and 0.36341  $\mu\text{g/L}$ , respectively; therefore, the arsenic and silver detected in sample Outfall 011 were qualified "UJ." Selenium was detected in both bracketing CCBs at 0.90784 and 0.80914  $\mu\text{g/L}$ , respectively; therefore, the selenium detected in sample Outfall 011 was qualified "UJ." No further qualifications were required due to the method and calibration blank results.

## 2.5 ICP INTERFERENCE CHECK SAMPLE (ICS A/AB)

No ICPMS interference check samples were analyzed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

An ICSA analysis was included in the raw data for the ICP boron analysis. This ICSA analysis was performed two days before the site sample analysis and was not associated with the initial calibration performed for sample Outfall.011. The laboratory's ICP SOP No. MET-200.7/6010B, Revision 8, states that the ICSA and ICSAB samples need to be run consecutively at the beginning and end of each analytical run. Due to the low level of matrix interferents in the site sample matrix, no sample qualifications were required due to the ICP ICS analysis.

## 2.6 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The ICP/MS LCS sample was identified as 5A05092-BS1, the ICP LCS sample was identified as 5A06063-BS1, and the Hg LCS sample was identified as 5A06051-BS1. The LCS results on the summary forms and in the raw data were within the laboratory-established ICP/MS, ICP, and Hg control limits of 85-115%. No qualifications were required.

## 2.7 LABORATORY DUPLICATES

No MS/MSD or duplicate analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.8 MATRIX SPIKE

No MS/MSD analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

## **2.10 ICP/MS AND ICP SERIAL DILUTION**

No serial dilution analyses were performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## **2.11 INTERNAL STANDARDS PERFORMANCE**

The ICP and ICP-MS internal standard recoveries for the site sample and associated QC sample analyses were within the 60-125% control limits and no qualifications were required.

## **2.12 SAMPLE RESULT VERIFICATION**

A Level IV review was performed for the samples in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. Analytes detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

## **2.13 FIELD QC SAMPLES**

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### **2.13.1 Field Blanks and Equipment Rinsates**

The sample in this SDG had no associated field QC samples. No qualifications were required.

### **2.13.2 Field Duplicates**

There were no field duplicate analyses performed in association with the site sample.

Reviewer: K. Shadowlight  
Date of Review: February 18, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Dioxins and Furans (DVP-19, Rev. 1)*, *EPA Method 1613*, and the *National Functional Guidelines For Chlorinated Dioxin/Furan Data Review (8/02)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample Identification**

Client ID	Laboratory ID (Del Mar)	Laboratory ID (Pace)	Matrix	COC Method

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The samples were subcontracted to Pace Analytical for the dioxin/furan analyses. The samples in these SDGs were received at Pace Analytical Services within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The samples were received in good condition at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs and transfer COCs were signed by the appropriate field and laboratory personnel. The samples and analyses were accounted for on both the original COCs and transfer COCs. As the samples were couriered directly to the laboratory (Del Mar Analytical), custody seals were not required. There was no information regarding custody seals upon receipt at Pace. No qualifications were required.

#### 2.1.3 Holding Times

The samples were extracted and analyzed within a year of collection. No qualifications were required.

### 2.2 INSTRUMENT PERFORMANCE

Following are findings associated with instrument performance:

#### 2.2.1 GC Column Performance

A column performance standard was combined with the daily calibration verification and analyzed at the beginning of each analytical sequence. The GC column performance was acceptable with the chromatographic separation of 2,3,7,8-TCDD and other TCDD isomers resolved with a valley of  $\leq 25\%$ . No qualifications were required.

#### 2.2.2 Mass Spectrometer Performance

The mass spectrometer performance could not be evaluated as the laboratory did not provide selected ion current profiles for the lock-mass ions. No qualifications were required.

## 2.3 CALIBRATION

### 2.3.1 Initial Calibration

There was one initial calibration, analyzed 11/29/04 on Instrument 10MSHR05. The calibration consisted of five concentration level standards (CS1 through CS5) analyzed to verify instrument linearity. The initial calibration was acceptable with %RSDs  $\leq 20\%$  for the 15 native compounds (calibration by isotope dilution) and  $\leq 35\%$  for the 2 native and all labeled compounds (calibration by internal standard). The relative retention times and ion abundance ratios were within the QC limits listed in Method 1613 for all standards. A representative number of %RSDs were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

### 2.3.2 Continuing Calibration

Calibration verification (VER) consisted of a mid-level standard (CS3) analyzed at the beginning of each analytical sequence. The VER was acceptable with the concentrations within the acceptance criteria listed in the Table 6 of the EPA Method 1613. The ion abundance ratios and relative retention times were within the method QC limits. A representative number of %Ds were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.4 BLANKS

One method blank (Blank-6220) was extracted and analyzed with the samples in these SDGs. Target compounds total HpCDF, 1,2,3,4,6,7,8-HpCDF, total HpCDF, OCDF, and OCDD were reported in the method blank. Any detects for the aforementioned target compounds reported at concentrations  $< 5\times$  the concentrations reported in the method blank were qualified as estimated nondetects "UJ," at the levels of interference in the samples of these SDGs. A review of the method blank raw data and chromatograms indicated no false negatives or false positives. No further qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One LCS/LCSD pair (LCS-6221/LCSD-6222) was extracted and analyzed with the samples in these SDGs. All recoveries were within the acceptance criteria listed in Table 6 of the Method 1613. There are no method QC limits established for RPDs. The reported RPDs were within  $\pm 20\%$ . No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were not performed in these SDGs. Evaluation of method accuracy and precision was based on the LCS/LCSD results. No qualifications were required.

## 2.7 FIELD QC SAMPLES

Following are findings associated with field QC:

### 2.7.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.7.2 Field Duplicates

No field duplicate samples were identified for these SDGs.

## 2.8 INTERNAL STANDARDS

The labeled standard recoveries were within the acceptance criteria listed in Table 7 of Method 1613. No qualifications were required.

## 2.9 COMPOUND IDENTIFICATION

The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613. The compound identifications were verified from the raw data and no false negatives or positives were noted. No qualifications were required.

## 2.10 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was verified from the raw data. The laboratory calculated and reported compound-specific detection limits. Any detects below the lower method calibration limit (MCL) were qualified as estimated, "J." Any reported EMPC was qualified as an estimated nondetect, "UJ." No further qualifications were required.

## NPDES Monitoring

ANALYSIS: HYDRAZINES

SAMPLE DELIVERY GROUPS: IOC2063 & IOC2064

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOC2063, IOC2064  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 2  
Reviewer: P. Meeks  
Date of Review: April 11, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**DATA VALIDATION REPORT**

Project: NPDES  
SDG No.: IOC2063, 2064  
Analysis: Hydrazines

**Table 1. Sample identification**

EPA ID	Del Mar ID	Laboratory ID	Matrix	COC Method
Outfall 011 Grab	IOC2063-01	941100	water	Hydrazines by 8315
Outfall 011 Composite	IOC2064-01	941101	water	Hydrazines by 8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for these SDGs noted that the samples were received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs from the field to Del Mar were signed and dated by field and laboratory personnel, and the transfer COCs from Del Mar to Truesdail Laboratories were signed and dated by personnel from both laboratories. Both the original COCs and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported. As the samples were transported to Del Mar and then to Truesdail by courier, no custody seals were required. Truesdail Laboratories did not list the Outfall 011 IDs on the Form Is; therefore, the reviewer hand-corrected the Form Is to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analysis. The samples were extraction within the three-day holding time and analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibration were analyzed 03/29/05, with correlation coefficients of  $\geq 0.995$  for the hydrazines. The ICV and CCV bracketing the sample analyses had recoveries for the hydrazines within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with these SDGs. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate was analyzed with these SDGs. The hydrazines were recovered within the laboratory-established control limits of 70%-130%, and the RPDs were within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on Outfall 011 Composite. The hydrazines were recovered within the laboratory-established control limits of 0%-150%; however, both recoveries were  $\geq 10\%$ . The RPDs were within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

### 2.7.1 Field Blanks and Equipment Rinsates

The site samples in these SDGs had no associated field QC. No qualifications were required.

### 2.7.2 Field Duplicates

There were no field duplicate samples in these SDGs.

## 2.8 COMPOUND IDENTIFICATION

The samples were analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Compound identification was verified, and review of the raw data indicated no compound identification errors. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified from the raw data at a Level IV data validation by recalculating LCS/LCSD and MS/MSD detects, as there were no sample detects. No compound quantitation problems were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## NPDES Monitoring

ANALYSIS: HYDRAZINES

SAMPLE DELIVERY GROUP: IOA0549

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## I. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0549  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 1  
Reviewer: P. Meeks  
Date of Review: March 09, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

EPA ID	Del Mar ID	Laboratory ID	Matrix	COC Method
Outfall 011 Grab	IOA0549-01	938566	water	Hydrazines by 8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for this SDG noted that the sample was received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC from the field to Del Mar was signed and dated by field and laboratory personnel, and the transfer COC from Del Mar to Truesdail Laboratories was signed and dated by personnel from both laboratories. Both the original COC and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported. As the sample was transported to Del Mar and then to Truesdail by courier, no custody seals were required. Truesdail Laboratories did not list the Outfall 011 ID on the Form I; therefore, the reviewer hand-corrected the Form I to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding time was assessed by comparing the date of collection with the date of analysis. The three-day extraction holding time for the hydrazine analysis was met and the sample was analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibrations were analyzed 01/13/05, with correlation coefficients of  $\geq 0.995$  for the hydrazines. The ICV and CCV bracketing the sample analyses had recoveries for the hydrazines within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with this SDG. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the samples were nondetects at the reporting limit. No qualifications were required.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate was analyzed with this SDG. The hydrazines were recovered within the laboratory-established control limits of 70%-130%, and the RPD was within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MSD/MSD analyses were performed on the Outfall 011. The recoveries for the hydrazines were within the laboratory QC limits of 0-150%; however, both recoveries were  $\geq 10\%$ . The RPDs were within the QC limit of  $\leq 20\%$ . No qualifications were required.

## 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site sample. Following are findings associated with field QC samples:

### 2.7.1 Field Blanks and Equipment Rinsates

The site sample in this SDG had no associated field QC. No qualifications were required.

### 2.7.2 Field Duplicates

There were no field duplicate samples in this SDG.

## 2.8 COMPOUND IDENTIFICATION

The sample was analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Compound identification was verified, and review of the raw data indicated no compound identification errors. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified from the raw data, at a Level IV data validation by recalculating LCS/LCSD and MS/MSD detects, as there were no sample detects. No compound quantitation problems were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

NPDES  
Monitoring

ANALYSIS: METALS

SAMPLE DELIVERY GROUP: IOA0549 & IOA0552

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0549, IOA0552  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Metals  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: P. Meeks  
Date of Review: March 10, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels III and IV ICP-MS Metals, (DVP-5-A, Rev.0)*, *AMEC Data Validation Procedure for Levels III and IV ICP Metals (DVP-5, Rev. 0)*, *SW-846 Method 6020B for Inductively Coupled Plasma – Mass Spectrometry*, *SW-846 Method 6010B for Inductively Coupled Plasma*, *SW-846 Method 7471A for Mercury (Manual Cold-Vapor Technique)*, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Laboratory ID	Matrix	COC Method
Outfall 011 Grab	Outfall 011 Grab	IOA0549-01	water	ILM04
Outfall 018	Outfall 018	IOA0552-01	water	ILM04

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at the laboratory within the temperature limits of 4°C ±2°C. No sample preservation, handling, or transport problems were noted, and no qualifications were necessary.

#### 2.1.2 Chain of Custody

The COCs were signed and dated by field and laboratory personnel. The COC for Outfall 011 Grab requested only a few of the presented analytes. The remaining analytes were requested in a memo from MWH personnel dated 03/01/05. The COC for Outfall 018 accounted for the sample and the analytes reported. No sample qualifications were required.

#### 2.1.3 Holding Times

The dates of collection recorded on the COCs and the dates of analyses recorded in the raw data, documented that the sample analyses were performed within the specified holding times of six months for the ICP/MS and ICP metals and 28 days for mercury. No qualifications were required.

### 2.2 ICP-MS TUNING

A precalibration routine must be completed prior to calibrating the instrument, which consists of analyzing a tuning solution to verify resolution, mass calibration, and thermal stability. The solution must be analyzed a minimum of five times and must contain isotopes representing all mass regions of interest. All %RSDs were less than 5%. The mass calibrations were within 0.1 amu of the true mass and the instrument resolutions were less than 0.75 amu at 5 percent peak height for all analytes in the tune solution. No site sample qualifications were required.

### 2.3 CALIBRATION

The ICV and CCV results showed acceptable recoveries, 90-110% for ICP and ICP/MS and 80-120% for mercury. The beryllium and nickel reporting limit check standard recoveries were above the control limit; therefore, beryllium and nickel detected in Outfall 011 Grab were qualified as estimated, "J." Thallium and antimony were not recovered in the 0.1 and 0.2 ppb reporting limit check standards, respectively; therefore, nondetected antimony in Outfall 011 Grab was qualified as estimated, "UJ," and thallium detected in Outfall 011 Grab was qualified as estimated, "J." The remaining reporting limit

check standards were recovered within the AMEC control limits of 70-130%. No further sample qualifications were required.

## 2.4 BLANKS

There were detects reported for the method blanks and bracketing ICBs/CCBs associated with the samples in these SDGs. Selenium and silver were detected in bracketing CCBs at 0.672 and 0.102  $\mu\text{g/L}$ , respectively; therefore, selenium and silver detected in Outfall 011 Grab were qualified as estimated, "UJ." Chromium was detected in the method blank (5A14051-BLK1) at 0.434  $\mu\text{g/L}$ ; therefore, chromium detected in Outfall 011 Grab was qualified as estimated, "UJ."

Antimony was detected in both bracketing CCBs at approximately 0.800  $\mu\text{g/L}$ . The CCB detects combined with the laboratory's inability to recover antimony in the 0.2 ppb reporting limit check standard indicated the laboratory could not detect antimony at the level reported in the CCBs. The reviewer, therefore, raised the MDL for antimony to the level reported in the CCBs, 0.80  $\mu\text{g/L}$ . No further qualifications were required due to the method and calibration blank results.

## 2.5 ICP INTERFERENCE CHECK SAMPLE (ICS A/AB)

ICSA and ICSAB analyses were included in the raw data for the ICP boron analysis, but were not run on the day Outfall 011 Grab was analyzed. The recoveries for the interferents and boron were within the control limits of 80-120%.

ICSA and ICSAB analyses were included in the raw data for three of the four ICP-MS analytical runs. Results were not provided for spiked interferents sulfur, phosphorus, carbon, and chloride and lead was not spiked into the ICSAB solution. The results for potassium were above the calibration range of the instrument in all of the ICSA and ICSAB analyses and the results for sodium were above the calibration range in one of the ICSA/ICSAB pairs. Positive results, greater than the applicable reporting limits were reported for manganese and cobalt. The validator reviewed the raw data for the site sample ICP/MS analysis for the level of reported interferents, Al, Ca, Fe, and Mg, and determined that the level of reported interferents were not high enough to cause matrix affects. No assessment could be made with respect to possible interference from sulfur, phosphorus, carbon, and chloride. No qualifications were required.

## 2.6 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The ICP/MS LCS samples were identified as 5A14051-BS1 and 5A12054-BS1. The ICP LCS sample was identified as 5A14046-BS1 and the Hg LCS sample was identified as 5A12047-BS1. The LCS results on the summary forms and in the raw data were within the laboratory-established ICP/MS, ICP, and Hg control limits of 85-115%. No qualifications were required.

## 2.7 LABORATORY DUPLICATES

The MS/MSD analyses were performed on Outfall 011 Grab for antimony, cadmium, copper, lead, nickel, and zinc only. The RPDs were less than the control limit of 20% and no qualifications were required.

## 2.8 MATRIX SPIKE

The MS/MSD analyses were performed on Outfall 011 Grab for antimony, cadmium, copper, lead, nickel, and zinc only. The recoveries were within the AMEC control limits of 75-125% and no qualifications were required.

## 2.9 FURNACE ATOMIC ABSORPTION QC

Furnace atomic absorption was not utilized for the analysis of these samples; therefore, furnace atomic absorption QC is not applicable.

## 2.10 ICP/MS AND ICP SERIAL DILUTION

No serial dilution analyses were performed in association with the samples in these SDGs; therefore, no assessment was made with respect to this criterion.

## 2.11 INTERNAL STANDARDS PERFORMANCE

The ICP and ICP-MS internal standard recoveries for the site samples and associated QC sample analyses were within the 60-125% control limits and no qualifications were required.

## 2.12 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the samples in these data packages. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. Analytes detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

## 2.13 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### **2.13.1 Field Blanks and Equipment Rinsates**

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### **2.13.2 Field Duplicates**

There were no field duplicate analyses performed in association with the site samples.

 Reviewer's Signature L. Calvin

ACTION ITEMS <sup>a</sup>	
1. Case Narrative Deficiencies	
2. Out of Scope Analyses	
3. Analyses Not Conducted	
4. Missing Hardcopy Deliverables	
5. Incorrect Hardcopy Deliverables	
6. Deviations from Analysis Protocol, e.g.,	Qualification was assigned for the following:
Holding Times	--continuing calibration %D >15%
GC/MS Tune/Inst. Performance	--surrogate recoveries below the QC limits
Calibration	
Method blanks	
Surrogates	
Matrix Spike/Dup LCS	
Field QC	
Internal Standard Performance	
Compound Identification	
Quantitation	
System Performance	
COMMENTS <sup>b</sup>	
<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements. <sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.	

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*#

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0549, IOA0552  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Pesticides/PCBs  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: March 10, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedures (DVP-4, Rev.2)*, *EPA Method 608*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the summary form as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Outfall 018	Outfall 018	IOA0552-01	water	608

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The COCs noted that the samples were received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs were signed and dated by both field and laboratory personnel. The COC for Outfall 018 accounted for the analysis presented in this SDG. The Method 608 analysis for Outfall 011 was not listed on the COC; however, the analysis was requested in a memo dated 03/01/05 from MWH personnel. As the samples were couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The water samples were extracted within seven days of sample collection and analyzed within 40 days of extraction. No qualifications were required.

### 2.2 PESTICIDES INSTRUMENT PERFORMANCE

No resolution check standards or breakdown check standards are required by Method 608 for pesticides, and according to the raw data provided, a resolution check standard was not analyzed by the laboratory. The laboratory did analyze a breakdown check standard with a breakdown of  $\leq 20\%$  for individual components (4,4-DDT and endrin) and  $\leq 30\%$  for the total, as suggested in the National Functional Guidelines. A review of the raw data indicated that the analytical run time was of sufficient length to provide adequate standard separation. The two analytical columns used in the analyses were within the guidelines specified in the methods.

According to the laboratory SOP and the initial calibration raw data, the retention time windows are  $\pm 0.10$  minutes for both surrogates and target compound calibration standards. A review of the raw data indicated that the laboratory retention time criteria were met for the surrogates and pesticide calibration standards. No qualifications were required.

### 2.3 CALIBRATION

#### 2.3.1 Analytical Sequence

Based on the data provided, the analytical sequences were in accordance with the requirements of Method 608. No qualifications were required.

### 2.3.2 Initial Calibration

There were two initial calibrations dated 10/26/04 and 12/29/04 associated with the pesticide analyses of the samples, which consisted of six point calibrations for all pesticide target compounds on two analytical columns. The %RSDs were within the EPA Method 608 QC limit of  $\leq 10\%$  on both analytical columns. There was one initial calibration dated 01/03/05 associated with the PCB analysis of sample Outfall 011, consisting of five points for Arochlor 1016 and Arochlor 1260. Single point calibrations for Arochlor 1242, Arochlor 1248, and Arochlor 1254 were also analyzed. The average %RSDs for the individual peaks of Arochlor 1016 and Arochlor 1260 were  $\leq 10\%$  on both analytical columns. An ICV was analyzed immediately following each of the initial calibrations. The %Ds for all target compounds were within the QC limits of 15% on both analytical columns. A representative number of %RSDs and ICV %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.3.3 Continuing Calibration

The pesticide analysis of sample Outfall 011 was bracketed by three continuing calibrations, one preceding and two following the analysis. In one of the bracketing calibrations following the sample analysis, the %D exceeded 15% on channel A for beta-bhc. As all results for this sample were reported from channel A, the nondetect result for beta-bhc was qualified as estimated, "UJ," in sample Outfall 011. The %Ds were within the Method QC limit of  $\pm 15\%$  for the remaining calibrations. The PCB analysis of this sample was bracketed by two CCVs and the %Ds for Arochlor 1016 and Arochlor 1260 were  $\leq 15\%$ .

The pesticide analysis of sample Outfall 018 was bracketed by three continuing calibrations. In two of the bracketing calibrations following the sample analysis, the %D exceeded 15% on channel A for alpha-bhc. As results were reported from channel B, no qualifications were assigned.

A representative number of %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.4 BLANKS

### 2.4.1 Instrument Blanks

An instrument blank was analyzed at the beginning of each analytical sequence. Cross-contamination was not evident in the samples. No qualifications were necessary.

### 2.4.2 Method Blanks

One water method blank (5A13049-BLK1) was extracted and analyzed with these SDGs. There were no pesticide target compounds or Aroclors detected in the method blank. Review of the chromatograms showed no false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One blank spike/blank spike duplicate pair (5A13049-BS1/BSD1) was extracted and analyzed with these SDGs. The recoveries for all spiked pesticide target compounds and Aroclors were within the laboratory-established QC limits and the RPDs were  $\leq 30\%$ . A representative number of

recoveries were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## **2.6 SURROGATE RECOVERY**

The sample and all QC samples were fortified with the surrogate compounds decachlorobiphenyl and tetrachloro-m-xylene. Surrogate recoveries for the pesticide and PCB analyses of sample Outfall 011 were within the laboratory-established QC limits. Both surrogates were recovered below the QC limits but  $\geq 10\%$  in Outfall 018. A notation on the extraction benchsheet and in the raw data indicated an emulsion that may have affected surrogate recoveries. The result for alpha-bhc in sample Outfall 018 was qualified as estimated, "UJ." The recoveries were calculated from the raw data and no transcription or calculation errors were noted. No further qualifications were required.

## **2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

There were no MS/MSD analyses associated with these SDGs. Method accuracy and precision were assessed based on the blank spike/blank spike duplicate results. No qualifications were required.

## **2.8 SAMPLE CLEANUP PERFORMANCE**

According to the laboratory extraction benchsheets, no cleanups were performed on the water samples. No qualifications were required.

## **2.9 FIELD QC SAMPLES**

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### **2.9.1 Field Blanks and Equipment Rinsates**

There were no field QC samples associated with the samples in these SDGs. No qualifications were required.

### **2.9.2 Field Duplicates**

There were no field duplicate samples associated with the sample in these SDGs.

## **2.10 COMPOUND IDENTIFICATION**

The laboratory analyzed for pesticide target compounds and PCBs by EPA Method 608. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for the samples in these SDGs. No qualifications were required.

## **2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS**

Compound quantification was verified for these SDGs; however, as there were no detects reported in the samples, quantitation was verified by recalculating a representative number of blank spike and surrogate recoveries. Reporting limits were supported by the low level standard of the initial calibration and the laboratory MDL studies. No qualifications were required.

## Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

NPDES Monitoring

ANALYSIS: VOLATILES

SAMPLE DELIVERY GROUP: IOA0549, IOA0552

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOA0549, IOA0552  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Volatiles  
QC Level: Level IV  
No. of Samples: 4  
No. of Reanalyses/Dilutions: 0  
Reviewer: K. Shadowlight  
Date of Review: March, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Volatile Organics (DVP-2, Rev. 2)*, *EPA Method 624*, *EPA SW-846 Method 8260B*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the summary forms as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Lab No.	Matrix	Method
Outfall 011	Outfall 011	IOA0549-01	water	624/8260B
Trip Blank	Trip Blank	IOA0549-02	water	624
Outfall 018	Outfall 018	IOA0552-01	water	624
Trip Blank	Trip Blank	IOA0552-02	water	624

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The samples were properly preserved. The COCs noted that the samples were received intact; however, information regarding absence of headspace was not provided. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs were signed and dated by both field and laboratory personnel. In a memo from Montgomery Watson dated 03/01/05, additional target compounds trichlorotrifluoroethane (Freon 113), 1,2-dichloro-1,1,2-trifluoroethane (Freon 123), and cyclohexane were requested for volatile analysis in sample Outfall 011. The COCs accounted for the remaining analyses presented in these SDGs. As the samples were couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The samples were analyzed within 14 days of collection. No qualifications were required.

### 2.2 GC/MS TUNING

The ion abundance windows shown on the quantitation reports were consistent with those specified in the EPA Method 624 and SW-846 Method 8260B, and all ion abundances were within the established windows. The samples and associated QC were analyzed within 12 hours of the BFB injection times. The Form Vs were verified from the raw data and no discrepancies between the summary forms and the raw data were noted. No qualifications were required.

### 2.3 CALIBRATION

Four initial calibrations dated 11/03/04 (acrolein and acrylonitrile only), 12/13/04 (GCMS36), 01/04/05 (GCMS33), and 01/04/05 (GCMS44) were associated with these SDGs. The average RRFs were  $\geq 0.05$  for all compounds listed on the sample result summaries. The %RSDs were  $\leq 35\%$  for the target compounds analyzed by EPA Method 624, and the %RSD for Freon 113 analyzed by EPA SW-846 Method 8260B was  $\leq 15\%$ . Three continuing calibrations associated with the sample analyses were analyzed 01/12/05 (instruments GCMS33, GCMS36, and GCMS44). The RRFs were  $\geq 0.05$  in all of the continuing calibrations. The %Ds for acrolein and acrylonitrile exceeded 20% in the continuing calibration analyzed on instrument GCMS33; therefore, the nondetect results for acrolein and acrylonitrile were qualified as estimated, "UJ," in sample Outfall 011. No qualifications were required for the Trip blank. The %Ds were  $\leq 20\%$  for the remaining

target compounds listed on the result summaries. A representative number of %RSDs and average RRFs from the initial calibrations, and %Ds and RRFs from the continuing calibrations were recalculated from the raw data, and no calculation or transcription errors were found. No further qualifications were required.

## 2.4 BLANKS

Three water method blanks (5A12003-BLK1, 5A12008-BLK1, and 512012-BLK1) were associated with the sample analyses. There were no detects above the MDLs for the target compounds listed on the sample result summaries. The method blank raw data showed no evidence of false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

Three water blank spikes (5A12003-BS1, 5A12008-BS1, and 5A12012-BS1) were associated with the sample analyses. All recoveries were within the laboratory-established QC limits. A representative number of recoveries were recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The surrogates were recovered within the QC limits of 80-120% in the samples and associated QC. A representative number of surrogate recoveries were recalculated from the raw data and no calculation or transcription errors were found. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed for samples Outfall 011 and Outfall 018 associated with these SDGs. All recoveries and RPDs were within QC limits for both MS/MSD pairs. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site sample. Following are findings associated with field QC samples:

### 2.8.1 Trip Blanks

Sample Trip Blank (IOA549) and Trip Blank (IOA552) were the trip blanks associated with site samples Outfall 011 and Outfall 018, respectively. Chlorobenzene was detected in Trip Blank (IOA549) at 0.73ug/L; however, chlorobenzene was not reported in associated sample Outfall 011. There were no other target compounds detected above the MDLs in the trip blanks. No qualifications were required.

### 2.8.2 Field Blanks and Equipment Rinsates

There were no field QC samples associated with these SDGs. No qualifications were required.

### 2.8.3 Field Duplicates

There were no field duplicate samples associated with these SDGs.

## 2.9 INTERNAL STANDARDS PERFORMANCE

Internal standard area counts and retention times for the samples in these SDGs were within the control limits established by the continuing calibration standards, of +100%/-50% for internal standard areas and  $\pm 0.50$  minutes for retention times. A representative number of internal standard areas and retention times were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.10 COMPOUND IDENTIFICATION

Target compound identification was verified at a Level IV data validation. The laboratory analyzed trichlorotrifluoroethane by EPA SW-846 8260B and the remaining volatile target compounds by EPA Method 624. A TIC search was performed for requested target compounds 1,2-dichloro-1,1,2-trichloroethane and cyclohexane, as these compounds were not included in the calibration (see section 2.11). Neither compound was detected as a TIC. Chromatograms, retention times, and spectra for the samples and QC were examined and no target compound identification problems were noted. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. The reporting limits were supported by the lowest concentrations of the initial calibration standards and by the MDL study. Calibration was not performed for target compounds 1,2-dichloro-1,1,2-trichloroethane and cyclohexane; therefore, the laboratory performed only a TIC search for those compounds. Nondetects for both compounds were qualified as estimated, "UJ," in sample Outfall 011. Compound quantitation was verified by recalculating any sample detects and a representative number of blank spike and surrogate recoveries from the raw data. Detects reported between the MDL and the reporting limit were qualified as estimated, "J," by the laboratory. Results were reported in  $\mu\text{g/L}$  (ppb). No calculation or transcription errors were noted. No further qualifications were required.

## 2.12 TENTATIVELY IDENTIFIED COMPOUNDS

The laboratory did not provide TICs for these SDGs. No qualifications were required.

## **2.13 SYSTEM PERFORMANCE**

A review of the chromatograms and other raw data showed no identifiable problems with system performance. No qualifications were required.

\* Subcontracted analytical laboratory is not meeting contract and/or method requirements.  
<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

### Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: GENERAL MINERALS

SAMPLE DELIVERY GROUP: IOA0549 & IOA0552

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0549 & IOA0552  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: General Minerals  
QC Level: Level IV  
No. of Samples: 2  
Reviewer: L. Jarusewic  
Date of Review: March 10, 2005

The sample listed in Table 1 was validated based on the guidelines outlined in the AMEC *Data Validation Procedures SOP DVP-6, Rev. 2, USEPA Methods for Chemical Analysis of Water and Wastes Method 300.0, 350.2, 330.5, 405.1, 335.2, 413.1, 415.1, 418.1, 425.1, 218.6, 120.1, 160.2, 160.5, 180.1, 150.1, and 120.1, Standard Methods for the Examination of Water and Wastewater Method SM5540-C and SM2540C*, and validation guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Laboratory ID	Matrix	COC Method
Outfall 011	Outfall 011	IOA0549-01	Water	General Minerals
Outfall 018	Outfall 018	IOA0552-01	Water	General Minerals

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No preservation problems were noted by the laboratory. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs were signed and dated by field and laboratory personnel. The COCs accounted for all analyses present in these SDGs except fluoride for Outfall 011. The fluoride analysis was requested in a memo from MWH personnel dated 03/01/05. No sample qualifications were required.

#### 2.1.3 Holding Times

The holding times were assessed by comparing the date of collection with the dates of analyses. The 28-day analytical holding time for ammonia, fluoride, chloride, sulfate, conductivity, total recoverable hydrocarbons, TOC, and oil and grease, the 14-day analytical holding time for cyanide, the seven-day holding time for total suspended solids and total dissolved solids, the 48-hour holding time for surfactants, turbidity, nitrate/nitrite, biological oxygen demand, and total settleable solids, and the 24-hour hexavalent chromium and residual chlorine holding times were met. No qualifications were required.

### 2.2 CALIBRATION

For the applicable analyses, the initial calibration correlation coefficients were  $\geq 0.995$ . Initial and continuing calibration information was acceptable with %Rs within the control limits of 90-110% for all analytes except hexavalent chromium. The CCV for hexavalent chromium exceeded the method control limits of 95-105%; however, as hexavalent chromium was not detected, no qualifications were required. For ammonia, no information regarding the standardization of the titrant was provided; however, as the LCS recovery was within the CCV control limits, no qualifications were required. For BOD, no information regarding the calibration of the oxygen meter was provided; however, as the LCS recovery was within the CCV control limits, no qualifications were required. Calibration is not applicable to residual chlorine or total settleable solids. The total cyanide RL check standard was recovered within the control limits of 70-130%. No qualifications were required.

### 2.3 BLANKS

Fluoride was detected in the associated method blank at 0.149 mg/L; therefore, fluoride detected in Outfall 011 was qualified as estimated, "UJ." Oil and grease was detected in the associated method blank for Outfall 011 and Outfall 018; however, the oil and grease method blank result was insufficient to qualify

the Outfall 011 and Outfall 018 results. Hexavalent chromium was detected in the associated method blank for Outfall 011; however, hexavalent chromium was not detected in Outfall 011 and no qualifications were required. The remaining method blank and CCB results reported on the summary forms and in the raw data for blank analyses associated with the samples were nondetects at the reporting limit. No further qualifications were required.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

The laboratory control sample and laboratory control sample duplicate (BOD, oil and grease, and total recoverable hydrocarbons only) recoveries and RPDs were within the laboratory-established control limits. The remaining LCS results were within the laboratory-established control limits. The LCS is not applicable to turbidity, conductivity, residual chlorine, or settleable solids. No qualifications were required.

## **2.5 SURROGATES RECOVERY**

Surrogate recovery is not applicable to the analyses presented in these SDGs.

## **2.6 LABORATORY DUPLICATES**

MS/MSD analyses were performed on Outfall 011 for hexavalent chromium. The RPD was within the control limit of  $\leq 20\%$ . No qualifications were required.

## **2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

MS/MSD analyses were performed on Outfall 011 for hexavalent chromium. The recoveries were within the laboratory-established control limits and no qualifications were required.

## **2.8 FURNACE ATOMIC ABSORPTION QC**

Furnace atomic absorption was not utilized for the analyses of these samples; therefore, furnace atomic absorption QC is not applicable.

## **2.9 ICP SERIAL DILUTION**

ICP serial dilution is not applicable to the analyses presented in this data validation report.

## 2.10 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the samples in these data packages. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. BOD results detected below the reporting limit were qualified as estimated, "J." No further qualifications were required.

## 2.11 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.11.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.11.2 Field Duplicates

There were no field duplicate pairs associated with these SDGs.

## Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
i	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
S	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
**	Unusual problems found with the data that have been described in Section 1, "Data Validation Findings." The number following the asterisk (*) will indicate the subsection where a description of the problem can be found.	Unusual problems found with the data that have been described in Section 1, "Data Validation Findings." # DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: PERCHLORATE

SAMPLE DELIVERY GROUPS: IOA0549 & IOA0552

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOA0549/IOA0552  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Perchlorate  
QC Level: Level IV  
No. of Samples: 2  
Reviewer: L. Jarusewic  
Date of Review: March 10, 2005

The sample listed in Table 1 was validated based on the guidelines outlined in the AMEC *Data Validation Procedures SOP DVP-6, Rev. 2, USEPA Methods for Chemical Analysis of Water and Wastes Method 314.0, and 120.1*, and validation guidelines outlined in the *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Laboratory ID	Matrix	COC Method
Outfall 011	Outfall 011	IOA0549-01	Water	Perchlorate
Outfall 018	Outfall 018	IOA0552-01	Water	Perchlorate

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in these SDGs were received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No preservation problems were noted by the laboratory. No qualifications were required.

#### 2.1.2 Chain of Custody

The COCs were signed and dated by field and laboratory personnel, and accounted for the samples and analysis presented in these SDGs. No qualifications were required.

#### 2.1.3 Holding Times

The holding time was assessed by comparing the date of collection with the dates of analysis. The 28-day analytical holding time for perchlorate was met, and no qualifications were required.

### 2.2 CALIBRATION

The initial calibration correlation coefficients were  $\geq 0.995$ . The IPC-MA recoveries were within the control limits of 80-120%. The ICV, CCV and IPC recoveries were within the control limits of 90-110%. No qualifications were required.

### 2.3 BLANKS

The method blank and CCB results reported on the summary forms and in the raw data for blank analyses associated with the sample were nondetects at the reporting limit. No qualifications were required.

### 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The laboratory control sample recoveries were within the method control limits of 85-115%. No qualifications were required.

### 2.5 SURROGATES RECOVERY

Surrogate recovery is not applicable to the analysis presented in these SDGs.

## 2.6 LABORATORY DUPLICATES

No MS/MSD or duplicate analyses were performed in association with the samples in these SDGs; therefore, no assessment was made with respect to this criterion.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MS/MSD analyses were performed in association with the samples in these SDGs; therefore, no assessment was made with respect to this criterion.

## 2.8 FURNACE ATOMIC ABSORPTION QC

Furnace atomic absorption was not utilized for the analysis of these samples; therefore, furnace atomic absorption QC is not applicable.

## 2.9 ICP SERIAL DILUTION

ICP serial dilution is not applicable to the analysis presented in this data validation report.

## 2.10 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the samples in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculations errors were noted. No qualifications were required.

## 2.11 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.11.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.11.2 Field Duplicates

There were no field duplicate pairs associated with these SDGs.

CORRECTIVE ACTION REPORT

Department: Extractions  
Method: EPA 625  
QC Batch: 5B14010

Date: 02/22/2005  
Matrix: Water

Identification and Definition of Problem:

The percent recovery for benzidine in the BSD was below method acceptance limits.

Determination of the Cause of the Problem:

Benzidine is known to be a problematic compound. According to the EPA, it can be subject to oxidative losses during solvent extraction and its chromatographic behavior is poor.

Corrective Action Taken:

The percent recovery in the BS was within the acceptance limits. All results reported for benzidine are potentially biased low and can be considered estimates only.

Matrix: Water

### Identification and Definition of Problem:

The Method Blank result for 2-Methylnaphthalene was above the reporting limit (8.7ppb).

### Determination of the Cause of the Problem:

A definitive cause for the QC failure has not been determined.

### Corrective Action Taken:

There was insufficient sample volume for re-analysis. Samples had J-flag hits and were flagged with 'B' qualifier.

Quality Assurance Approval:

### DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- C** Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
- C5** Calibration Verification recovery was below the method control limit for this analyte. An additional check standard was analyzed at the reporting limit to ensure instrument sensitivity at the reporting limit. Samples ND.
- J** Estimated value. Analyte detected at a level less than the Reporting Limit (RL) and greater than or equal to the Method Detection Limit (MDL). The user of this data should be aware that this data is of unknown quality.
- L2** Laboratory Control Sample recovery was below method control limits.
- M-NR1** There was no MS/MSD analyzed with this batch due to insufficient sample volume. See Blank Spike/Blank Spike Duplicate.
- R-7** LFB/LFBD RPD exceeded the method control limit. Recovery met acceptance criteria.
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

### ADDITIONAL COMMENTS

**For TICs:**

All identifications are tentative and concentrations are estimates based upon spectral comparison to the EPA/NIH library.

**For 1,2-Diphenylhydrazine:**

The result for 1,2-Diphenylhydrazine is based upon the reading of its breakdown product, Azobenzene.

**For GRO (C4-C12):**

GRO (C4-C12) is quantitated against a gasoline standard. Quantitation begins immediately following the methanol peak.

**For Extractable Fuel Hydrocarbons (EFH, DRO, ORO) :**

Unless otherwise noted, Extractable Fuel Hydrocarbons (EFH, DRO, ORO) are quantitated against a Diesel Fuel Standard.

 Pasadena, CA 91101

Attention: Bronwyn Kelly  
 Project: 13267 (Study1)/Outfall 011  
 Sampled: 02/11/05  
 Del Mar Analytical Number: IOB1014

Dear Ms. Kelly:

Aquatic Testing Laboratories performed the Fathead Minnow 96 hr Percent Survival Bioassay (EPA Method 2000.0), Eberline Services tested gross alpha/gross beta (EPA 900.0), tritium (H-3, EPA 906.0), and strontium-90 (Sr-90, EPA 905.0) and Alta Analytical Perspectives performed Method 1613 Dioxin, and Truesdail Laboratories performed the Hydrazines by EPA 8315 analysis for the project referenced above. Please use the following cross-reference table when reviewing your results.

MWH ID	DEL MAR ID	ATL ID	EBERLINE ID	ALTA ID	TRUESDAIL ID
Outfall 011-grab	IOB1014-01	A-05021210-001/002	R502135-8264	P5072 2989 005	939705-1

Attached are the original reports from the subcontract laboratories. If you have any questions or require further assistance, please do not hesitate to contact me at (949) 261-1022 at extension 215.

Sincerely yours,  
 DEL MAR ANALYTICAL

  
 Michele Harper  
 Project Manager

# LABORATORY REPORT

*"dedicated to providing quality aquatic toxicity testing"*

**Date:** February 19, 2005  
**Client:** Del Mar Analytical, Irvine

# FATHEAD MINNOW PERCENT SURVIVAL TEST

Lab No.: A-05021210-001  
 Client/ID: Del Mar IOB1014-01

Start Date: 02/12/2005

## TEST SUMMARY

Species: *Pimephales promelas*.  
 Age: 13 (1-14) days.  
 Regulations: NPDES.  
 Test solution volume: 250 ml.  
 Feeding: prior to renewal at 48 hrs.  
 Number of replicates: 2.  
 Dilution water: Moderately hard reconstituted water.  
 Photoperiod: 16/8 hrs light/dark.

Source: In-laboratory Culture.  
 Test type: Static-Renewal.  
 Test Protocol: EPA-821-R-02-012.  
 Endpoints: Percent Survival at 96 hrs.  
 Test chamber: 600 ml beakers.  
 Temperature: 20 +/- 1°C.  
 Number of fish per chamber: 10.  
 QA/QC Batch No.: RT-050208.

**CERIODAPHNIA CHRONIC BIOASSAY  
EPA METHOD 1002.0**

Lab No.: A-05021210  
Client/ID: Del Mar IOB1014-01

Date Tested: 02/12/05 to 02/18/05

**TEST SUMMARY**

Test type: Daily static-renewal.  
Species: *Ceriodaphnia dubia*.  
Age: <24 hrs; all released within 8 hrs.  
Test vessel size: 30 ml.  
Number of test organisms per vessel: 1.  
Temperature: 25 +/- 1°C.  
Dilution water: Mod. hard reconstituted (MHRW).  
QA/QC Batch No.: RT-050204.

Endpoints: Survival and Reproduction.  
Source: In-laboratory culture.  
Food: .1 ml YTC, algae per day.  
Test solution volume: 15 ml.  
Number of replicates: 10.  
Photoperiod: 16/8 hrs. light/dark cycle.  
Test duration: 7 days.  
Statistics: ToxCalc computer program.

**RESULTS SUMMARY**

Sample Concentration	Percent Survival	Mean Number of Young Per Female
Control	100%	27.6
6.25%	100%	27.3
12.5%	100%	26.2
25%	100%	27.7
50%	100%	28.9
100%	100%	24.6

\* Statistically significantly less than control at P = 0.05 level.  
\*\* Reproduction data from concentrations greater than survival NOEC are excluded from statistical analysis.

**CHRONIC TOXICITY**

Parameter	Survival	Growth
NOEC	100%	100%
TUc	1.0	1.0

**QA/QC TEST ACCEPTABILITY**

Parameter	Result
Control survival ≥80%	Pass (100% survival)
≥15 young per surviving control female	Pass (27.6 young)
≥60% surviving controls had 3 broods	Pass (100% with 3 broods)
PMSD <47% for reproduction; if >47% and no toxicity at IWC, the test must be repeated	Pass (PMSD = 13.6%)
Statistically significantly different concentrations relative difference >13%	NA - No stat. sig. diff. concentrations
Concentration response relationship acceptable	Pass (slight response at conc. tested)

# EBERLINE SERVICES

March 8, 2005

Ms. Michele Harper  
Project Manager  
Del Mar Analytical  
17461 Derian Avenue, Suite 100  
Irvine, CA 92614

Reference: Del Mar Analytical Project No. IOB1014  
Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R502135-8264

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 15, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0). The QC LCS, blank analyses, sample duplicates, and matrix spike results for the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

 7. Number of containers per sample: 3 (Or see CoC \_\_\_\_\_)  
 8. Samples are in correct container Yes  No   
 9. Paperwork agrees with samples? Yes  No   
 10. Samples have: Tape  Hazard labels  Rad labels  Appropriate sample labels   
 11. Samples are: In good condition  Leaking  Broken Container  Missing   
 12. Samples are: Preserved  Not preserved  pH <2 Preservative HNO3  
 13. Describe any anomalies: Labels on samples IOB1014-01 AF and IOB1014-01AH are switched. 1 gallon pdy bottle shows IOB1014-01AH and 40ml vial shows IOB1014-01AF  
 14. Was P.M. notified of any anomalies? Yes  No  Date 2/15/05  
 15. Inspected by Z/kg Date: 2/15/05 Time: 10:00

Subject: Certificate of Results

Dear Scott;

Attached to this narrative are the analytical results you requested on the samples submitted for the determination of polychlorinated dibenzo-*p*-dioxins and dibenzofurans. The insert below summarizes the relevant information pertaining to your project. In particular, the QC annotations bring to your attention specific analytical observations and assessments made during the sample handling and data interpretation phases. A brief description of the report's components is provided on the next page.

Project Information Summary	When applicable, see QC Annotations for details
Client Project No. AAP Project No. Analytical Protocol	P5072 Method 1613B
No. Samples Submitted	13
No. Samples Analyzed	13
No. Laboratory Method Blanks	1
No. OPRs / Batch CS3	1
No. Outstanding Samples	0
Date Received	1-Mar-2005
Condition Received	good
Temperature upon Receipt (C)	1-3
Extraction within Holding Time	yes
Analysis within Holding Time	yes
Data meet QA/QC Requirements	yes
Exceptions	none
Analytical Difficulties	none

**QC Annotations:**

1. A "J" data qualifier is used for analytes with a concentration below the reporting limit.

Alta Analytical Perspectives remains committed to serving you in the most effective manner. Should you have any questions or need additional information and technical support, please, do not hesitate to contact us. We wanted to thank you for choosing Alta Analytical Perspectives as part of your analytical support team.

Sincerely,

Amy J. Boehm  
Project Manager

Irvine, CA 92614  
**Attention:** Michele Harper

**Project Name:** IOB1014  
**Date Received:** 02/14/05

**Truesdail Project:** 939705

## Case Narrative

**Sample Receipt** The sample was received in good condition and no anomalies were noted during check-in. The sample was kept in a locked refrigerator until analysis. Thereafter, it is being kept in ambient storage for an additional 2 months before disposal.

**Analysis** The analysis was performed as requested on the chain-of-custody.

**Quality Control** The analytical results for each batch of samples performed include a minimum of one set of laboratory control sample/laboratory control sample duplicate (LCS/LCSD), one matrix spike (MS) and a reagent blank (Method blank). Any exceptions or problems would be noted in the "comments" section.

**Comments** The test results in this report meet all quality assurance requirements set forth by the method specification and all quality control recoveries were within the laboratory acceptance limits. No anomalies or nonconformance events occurred during the course of analysis.

The analytes were quantitated down to the Method Detection Limit (J flags) per client's request.

Respectfully Submitted,

Reference: Del Mar Analytical Project No. IOB1014  
Eberline Services NELAP Cert #01120CA (exp. 01/31/06)  
Eberline Services Report R502135-8264

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on February 15, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0); results for those analyses were reported on March 8. This report contains the analytical results for Ra-226 (EPA903.1) and Ra-228 (EPA904.0). The Ra-226 QC samples are 8368-005, 006, and 007, and the Ra-228 QC samples are 8263-002, 003, and 004. The QC LCS, blank analyses, and sample duplicates for both the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. Analyses that involve the yielding of an analytical tracer or carrier, such as Sr-90 and Ra-228, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

Eberline Services Report R505129-8347

Dear Ms. Harper:

Enclosed are results from the analyses of one water sample received at Eberline Services on March 22, 2005. The sample was analyzed according to the accompanying Del Mar Analytical Subcontract Order Form. The requested analyses were gross alpha/gross beta (EPA900.0), tritium (H-3, EPA906.0), and strontium-90 (Sr-90, EPA905.0); results for those analyses were reported on May 4. This report contains the analytical results for Ra-226 (EPA903.1) and Ra-228 (EPA904.0). The QC LCS, blank analyses, duplicates analysis (ra-226 only) result for both the analyses were within the limits defined in Eberline Services Quality Control Procedures Manual. The Ra-226 matrix spike analysis recovery was 57%. Analyses that involve the yielding of an analytical tracer or carrier, such Ra-228, do not require matrix spike analyses to be performed.

Please call me if you have any questions concerning this report.

Regards,

Melissa Mannion  
Senior Program Manager

3. Analyses Not Conducted	
4. Missing Hardcopy Deliverables	
5. Incorrect Hardcopy Deliverables	
6. Deviations from Analysis Protocol, e.g., Holding Times GC/MS Tune/Inst. Perform Calibrations Blanks Surrogates Matrix Spike/Dup LCS Field QC Internal Standard Performance Compound Identification and Quantitation System Performance	Detects below the calibration range were qualified "J." False negative and false positives noted. Several transcription errors were noted.
COMMENTS <sup>b</sup>	
<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements. <sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.	

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

# DATA VALIDATION REPORT

## NPDES Monitoring

ANALYSIS: DIOXINS/FURANS

SAMPLE DELIVERY GROUPS: Multiple SDGs

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: Multiple SDGs  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Dioxins/Furans  
QC Level: Level IV  
No. of Samples: 13  
No. of Reanalyses/Dilutions: 0  
Reviewer: H. Chang  
Date of Review: March 18, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Dioxins and Furans (DVP-19, Rev. 1)*, *EPA Method 1613*, and the *National Functional Guidelines For Chlorinated Dioxin/Furan Data Review (8/02)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample Identification**

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

All of the samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$  except sample Outfall 009 which was at  $8^{\circ}\text{C}$ . Due to non-volatile nature of the analytes, no qualifications were necessary for the elevated cooler temperature. The samples were received at Pace Analytical with cooler temperatures of  $1.6^{\circ}\text{C}$ ,  $2.3^{\circ}\text{C}$ , and  $3^{\circ}\text{C}$ . The samples were received at Alta Analytical Perspectives with cooler temperatures of  $1^{\circ}\text{C}$  and  $3^{\circ}\text{C}$ . According to the laboratory login sheets, all samples were received intact and in good condition at Del Mar and Alta AP. No sample conditions were available for review for the sample receipt at Pace. No qualifications were required.

#### 2.1.2 Chain of Custody

It appears that the samples were initially sent from Del Mar Analytical to Pace Analytical then subsequently shipped to Alta Analytical Perspectives. The COCs from the field to Del Mar, Del Mar to Pace, and Pace to Alta were available for review. The COCs were legible and signed by the appropriate field and laboratory personnel, and accounted for the analyses presented in these SDGs. The custody seals were not present on the coolers upon receipt at either Del Mar or Alta. No custody seal information was available for Pace. No qualifications were required.

#### 2.1.3 Holding Times

The samples were extracted and analyzed within a year of collection. No qualifications were required.

### 2.2 INSTRUMENT PERFORMANCE

Following are findings associated with instrument performance:

#### 2.2.1 GC Column Performance

A Column Performance Check Standard (CPSM) containing the first and last eluting congeners of each descriptor and isomer specificity compounds was analyzed prior to initial calibration analysis. A separate CPSM was not analyzed for daily analytical sequence; instead, CPSM compounds were added to OPR analysis. The GC column performance in the calibrations was acceptable, with the height of the valley between the closely eluting isomers and 2,3,7,8-TCDD reported as less than 25%. No qualifications were required.

#### 2.2.2 Mass Spectrometer Performance

The mass spectrometer performance was acceptable with the static resolving power greater than 10,000. No qualifications were required.

## 2.3 CALIBRATION

### 2.3.1 Initial Calibration

There was one initial calibrations, analyzed 08/12/04. The calibrations each consisted of six concentration level standards (CS0 through CS5) analyzed to verify instrument linearity. The initial calibration was acceptable with %RSDs  $\leq 20\%$  for the native compounds and  $\leq 35\%$  for the labeled compounds. The relative retention times and ion abundance ratios were within the QC limits listed in Method 1613 for all standards. A representative number of %RSDs were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

### 2.3.2 Continuing Calibration

Calibration verification (VER) consisted of a mid-level standard (CS3) analyzed at the beginning of each analytical sequence. The VERs were acceptable with the concentrations within the acceptance criteria listed in Table 6 of EPA Method 1613. The ion abundance ratios and relative retention times were within the method QC limits. A representative number of %Ds were verified from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.4 BLANKS

One method blank (0\_2989\_MB001) was extracted and analyzed with the samples in these SDGs. There were no detects reported in the method blank. A review of the method blank raw data and chromatograms indicated no false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One Ongoing Precision Recovery (OPR) sample (0\_2989\_OPR001) was extracted and analyzed with the samples in these SDGs. All recoveries were within the acceptance criteria listed in Table 6 of the Method 1613. No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were not performed in these SDGs. Evaluation of method accuracy was based on the OPR results. No qualifications were required.

## 2.7 FIELD QC SAMPLES

Following are findings associated with field QC:

### 2.7.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.7.2 Field Duplicates

No field duplicate samples were identified for these SDGs.

## 2.8 INTERNAL STANDARDS

The labeled standard recoveries were within the acceptance criteria listed in Table 7 of Method 1613. No qualifications were required.

## 2.9 COMPOUND IDENTIFICATION

The laboratory analyzed for polychlorinated dioxins/furans by EPA Method 1613. The compound identifications were verified from the raw data. The laboratory reported total PeCDFs detects in samples Outfall 005, Outfall 006, Outfall 007, and Outfall 011. The reviewer deemed the signals used to be below the signal-to-noise ratio of 2.5 and the results were changed to nondetects. A false negative for total HxCDD was noted in sample Outfall 001 and was changed to a detect. No further qualifications were required.

## 2.10 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was verified from the raw data. The laboratory calculated and reported compound-specific detection limits. Any detects below the lower method calibration level (MCL) were qualified as estimated, "J." The laboratory did not flag OCDD in samples Outfall 002 and Outfall 003 although the reported concentrations were below the lower MCL. OCDD in these samples was qualified as estimated, "J." In addition, Alta analyzed an additional calibration standard at concentrations below the level specified in the method. Not all results below the lower MCLs were flagged as estimated by the laboratory. These results were qualified as estimated, "J," by the reviewer. The laboratory also did not flag detects below the lower MCL for totals as estimated. These totals were qualified as estimated, "J." The "DNQ" qualification code was applied only if all components of the totals were below the lower MCL. Total HpCDF in samples Outfall 001 and Outfall 010 had one of the components below the lower MCL but one within the MCL. Total HpCDF in these samples were qualified as estimated, "J."

The laboratory indicated that one of the non-2,3,7,8 substituted HxCDD detect, present in majority of the samples, was due to recovery standard (13C-1,2,3,4,6,7-HxCDD) contribution. This compound was also present in the method blank. This compound was not included in the total HxCDD concentration. Several total HxCDD results could not be reproduced from the raw data by the reviewer and were hand-corrected on the Form I. No further qualifications were required.

<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.

# DATA VALIDATION REPORT

NPDES  
Monitoring

ANALYSIS: HYDRAZINES

SAMPLE DELIVERY GROUP: IOB1014

Prepared by

AMEC—Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
Sample Delivery Group #: IOB1014  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Hydrazines  
QC Level: Level IV  
No. of Samples: 1  
Reviewer: P. Meeks  
Date of Review: April 01, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the USEPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review (2/94)*, and USEPA SW-846 Method 8315. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

EPA ID	Del Mar ID	Laboratory ID	Matrix	COC Method
Outfall 011	IOB1014-01	939705	water	Hydrazines by 8315

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical and the subcontract laboratory, Truesdail Laboratories, within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The case narratives for this SDG noted that the sample was received intact at both laboratories. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC from the field to Del Mar was signed and dated by field and laboratory personnel, and the transfer COC from Del Mar to Truesdail Laboratories was signed and dated by personnel from both laboratories. Both the original COC and transfer COCs requested only monomethyl hydrazine analysis; however, unsymmetrical dimethyl hydrazine and hydrazine were also reported. As the sample was transported to Del Mar and then to Truesdail by courier, no custody seals were required. Truesdail Laboratories did not list the Outfall 011 ID on the Form I; therefore, the reviewer hand-corrected the Form I to include this information. No qualifications were required.

#### 2.1.3 Holding Times

The holding time was assessed by comparing the date of collection with the date of analysis. The sample was extraction within the three-day holding time; and was analyzed within three days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The five-point initial calibrations were analyzed 02/14/05, with correlation coefficients of  $\geq 0.995$  for the hydrazines. The ICV and CCV bracketing the sample analysis had recoveries for the hydrazines within the QC limits of 85-115%. No qualifications were required.

### 2.3 BLANKS

One method blank was analyzed with this SDG. The results reported on the method blank summary form and in the raw data for the instrument and method blank analyses associated with the sample were nondetects at the reporting limit. No qualifications were required.

## 2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One laboratory control sample/laboratory control sample duplicate was analyzed with this SDG. The hydrazines were recovered within the laboratory-established control limits of 70%-130%, and the RPDs were within the control limit of  $\leq 20\%$ . No qualifications were required.

## 2.5 SURROGATES RECOVERY

Surrogates were not utilized in this analysis. No qualifications were required.

## 2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MSD/MSD analyses were performed on Outfall 011; therefore, no assessment was made with respect to this criterion. Method accuracy and precision were evaluated based on LCS/LCSD results. No qualifications were required.

## 2.7 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site sample. Following are findings associated with field QC samples:

### 2.7.1 Field Blanks and Equipment Rinsates

The site sample in this SDG had no associated field QC. No qualifications were required.

### 2.7.2 Field Duplicates

There were no field duplicate samples in this SDG.

## 2.8 COMPOUND IDENTIFICATION

The sample was analyzed by HPLC for monomethyl hydrazine, unsymmetrical dimethyl hydrazine, and hydrazine by Method 8315. Compound identification was verified, and review of the raw data indicated no compound identification errors. No qualifications were required.

## 2.9 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified from the raw data at a Level IV data validation by recalculating LCS/LCSD and MS/MSD detects, as there were no sample detects. No compound quantitation problems were noted. The hydrazine reporting limits were supported by the lower levels of the initial calibration. No qualifications were required.

### Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

### Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive - reported compound was not present. Not applicable.	
-	False negative - compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*# Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB1014  
Project Manager: B. Mellvaine  
Matrix: Water  
Analysis: Metals  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: K. Okonzak-Lowry  
Date of Review: April 5, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels III and IV ICP-MS Metals, (DVP-5-A, Rev.0)*, *AMEC Data Validation Procedure for Levels III and IV ICP Metals (DVP-5, Rev. 0)*, *SW-846 Method 6020B for Inductively Coupled Plasma – Mass Spectrometry*, *SW-846 Method 6010B for Inductively Coupled Plasma*, *SW-846 Method 7471A for Mercury (Manual Cold-Vapor Technique)*, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . No sample preservation, handling, or transport problems were noted, and no qualifications were necessary.

#### 2.1.2 Chain of Custody

The COC was signed and dated by field and laboratory personnel and accounted for the analyses presented in the data package. No sample qualifications were required.

#### 2.1.3 Holding Times

The date of collection recorded on the COC and the dates of analysis recorded in the raw data, documented that the sample analyses were performed within the specified holding times of six months for the ICP/MS and ICP metals and 28 days for mercury. No qualifications were required.

### 2.2 ICP-MS TUNING

A precalibration routine must be completed prior to calibrating the instrument, which consists of analyzing a tuning solution to verify resolution, mass calibration, and thermal stability. The solution must be analyzed a minimum of five times and must contain isotopes representing all mass regions of interest. The laboratory performed the required tune solution analyses. The %RSDs for the tune were all within the 5% control limit. The mass calibrations were within 0.1 amu of the true mass and the instrument resolutions were less than 0.75 amu at 5 percent peak height for all analytes in the tune solution. No site sample qualifications were required.

**2.3 CALIBRATION**

The ICV and CCV results showed acceptable recoveries, 90-110% for the ICP/MS and ICP metals and 80-120% for mercury. The applicable reporting limit check standards were recovered within the AMEC control limits of 70-130%, with the following exceptions: arsenic was recovered at 47.9% in the 1.0 µg/L standard, nickel was recovered at 8.6% and 60.5%, respectively, in the 1.0 and 2.0 µg/L standards, and copper was recovered at 67% in the 2.0 µg/L standard. Therefore, the arsenic, nickel and copper detects for sample Outfall 011-grab were qualified as estimated, "J." No further qualifications were required.

**2.4 BLANKS**

There were detects and negative results reported in the associated method blank and calibration blank (CCB) analyses. The sample results were qualified for the blanks results as follows:

Findings	Associated Samples	Qualification of Data
Boron was detected in the bracketing CCBs at 0.025 and 0.021 mg/L, respectively.	Outfall 011-grab	Boron detected in the sample was qualified, "UJ."
Chromium was detected in method blank 5B12041-BLK1 at 0.846 µg/L. The validator chose to report this original chromium MB result as opposed to the rerun MB result that the laboratory had reported for chromium, due to the fact that the original MB analysis was performed along with the site sample chromium analysis and is more indicative of the instrument conditions applicable to the chromium analysis.	Outfall 011-grab	Chromium detected in the sample was qualified, "UJ."
Nickel and vanadium were reported in method blank 5B12041-BLK1 at -0.77 and -0.98 µg/L, respectively.	Outfall 011-grab	Nickel and vanadium detected in the sample were qualified, "J."
Antimony was detected in the bracketing CCBs at 0.89 and 0.81 µg/L, respectively	Outfall 011-grab	The antimony detected in the sample was qualified, "UJ," at a raised MDL of 0.9 µg/L.

**2.5 ICP and ICP/MS INTERFERENCE CHECK SAMPLE (ICS A/AB)**

The results for the ICSA/ICSAB analyses reported in the raw data for the ICP analysis were within established control limits. No qualifications were required. There were no ICSA/AB analyses associated with the ICP/MS sample analyses; therefore, the ICP/MS results were not assessed for this criterion.

## 2.6 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

The ICP/MS LCS sample was identified as 5B12041-BS1, and the ICP LCS sample was identified as 5B12044-BS1. The mercury LCS sample was identified as 5B12033-BS1. The LCS results on the summary forms and in the raw data were within the laboratory-established ICP/MS, ICP, and mercury control limits of 85-115%. No qualifications were required.

## 2.7 LABORATORY DUPLICATES

No MS/MSD analyses were associated with the site sample in this SDG; therefore, the sample was not assessed for this criterion.

## 2.8 MATRIX SPIKE

No MS/MSD analyses were associated with the site sample in this SDG; therefore, the sample was not assessed for this criterion. Method accuracy was assessed based on the LCS results.

## 2.9 FURNACE ATOMIC ABSORPTION QC

Furnace atomic absorption was not utilized for the analysis of this sample; therefore, furnace atomic absorption QC is not applicable.

## 2.10 ICP/MS SERIAL DILUTION

No serial dilution analysis was performed in association with the sample in this SDG; therefore, no assessment was made with respect to this criterion.

## 2.11 INTERNAL STANDARDS PERFORMANCE

The ICP-MS internal standard recoveries associated with the site sample and associated QC sample analyses, were within the 60-125% control limits and no qualifications were required.

## 2.12 SAMPLE RESULT VERIFICATION

A Level IV review was performed for the sample in this data package. Calculations were verified, and the sample results reported on the Form Is were verified against the raw data. No transcription errors or calculation errors were noted. Analytes detected below the reporting limit in sample Outfall 011-grab were qualified as estimated, "J." For the ICP/MS run, the antimony detects in the associated CCBs were found at approximately 2× the level of the 0.44 µg/L detect for antimony in sample Outfall 011-grab. Therefore, the antimony detected in sample Outfall 011-grab was qualified as estimated, "UJ," at a raised MDL of 0.9 µg/L. No qualifications were required.

## 2.13 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.13.1 Field Blanks and Equipment Rinsates

The sample in this SDG had no associated field QC samples. No qualifications were required.

### 2.13.2 Field Duplicates

There were no field duplicate analyses performed in association with the site sample.

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB1014  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: Pesticides/PCBs  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: April 6, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedures (DVP-4, Rev.2)*, *EPA Method 608*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the summary form as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

Outfall 011-Grab	Outfall 011-Grab	IOB1014-01	water	608

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample was received at the laboratory within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The analysis did not require preservation, and no preservation was noted in the field. The COC noted that the sample was received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. The COC accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The water sample was extracted within seven days of sample collection and analyzed within 40 days of extraction. No qualifications were required.

### 2.2 PESTICIDES INSTRUMENT PERFORMANCE

No resolution check standards or breakdown check standards are required by Method 608 for pesticides, and according to the raw data provided, a resolution check standard was not analyzed by the laboratory. The laboratory did analyze a breakdown check standard with a breakdown of  $\leq 20\%$  for individual components (4,4-DDT and endrin) and  $\leq 30\%$  for the total, as suggested in the National Functional Guidelines. A review of the raw data indicated that the analytical run time was of sufficient length to provide adequate standard separation. The two analytical columns used in the analyses were within the guidelines specified in the methods.

According to the laboratory SOP and the initial calibration raw data, the retention time windows are  $\pm 0.10$  minutes for both surrogates and target compound calibration standards. A review of the raw data indicated that the laboratory retention time criteria were met for the surrogates and pesticide calibration standards. No qualifications were required.

### 2.3 CALIBRATION

#### 2.3.1 Analytical Sequence

Based on the data provided, the analytical sequences were in accordance with the requirements of Method 608. No qualifications were required.

### 2.3.2 Initial Calibration

There was one initial calibration dated 02/17/05 associated with the pesticide analysis of the sample, which consisted of six point calibrations for all pesticide target compounds on two analytical columns. The %RSDs were within the EPA Method 608 QC limit of  $\leq 10\%$  or the  $r^2$  values were  $\geq 0.995$  on both analytical columns. There was one initial calibration dated 02/11/05 associated with the PCB analysis of the sample which consisted of five points for Aroclor 1016 and Aroclor 1260. Single point calibrations for Aroclor 1242, Aroclor 1248, and Aroclor 1254 were also analyzed. The average %RSDs for the individual peaks of Aroclor 1016 and Aroclor 1260 were  $\leq 10\%$  or the  $r^2$  values were  $\geq 0.995$  on both analytical columns. An ICV was analyzed immediately following each of the initial calibrations. The %Ds for all target compounds were within the QC limits of 15% on both analytical columns. A representative number of %RSDs and ICV %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.3.3 Continuing Calibration

In the continuing calibrations bracketing the pesticide analysis of the sample, all %Ds were  $\leq 15\%$  with the exception of %Ds for 4,4'-DDT, endrin aldehyde, methoxychlor, and endrin ketone in one or more of the calibrations. Nondetect results for the aforementioned compounds were qualified as estimated, "UI," in sample Outfall 011-Grab. Of the continuing calibrations associated with the PCB analysis of the sample, all %Ds were  $\leq 15\%$  for Aroclor 1016 and Aroclor 1260. A representative number of %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No further qualifications were required.

## 2.4 BLANKS

### 2.4.1 Instrument Blanks

An instrument blank was analyzed at the beginning of each analytical sequence. Cross-contamination was not evident in the samples. No qualifications were necessary.

### 2.4.2 Method Blanks

One water method blank (5B17042-BLK1) was extracted and analyzed with this SDG. There were no pesticide target compounds or Aroclors detected in the method blank. Review of the chromatograms showed no false negatives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One blank spike/blank spike duplicate pair (5B17042-BS1/BSD1 for pesticides and -BS2/-BSD2 for PCBs) was extracted and analyzed with this SDG. The recoveries for all spiked pesticide target compounds and Aroclors were within the laboratory-established QC limits and the RPDs were  $\leq 30\%$  for pesticides, and  $\leq 30\%$  and  $\leq 25\%$  for Aroclors 1016 and 1260, respectively. A representative number of recoveries were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample and all QC samples were fortified with the surrogate compounds decachlorobiphenyl and tetrachloro-*m*-xylene. Surrogate recoveries for the pesticide and PCB analyses of the samples were within the laboratory-established QC limits. The recoveries were calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

There were no MS/MSD analyses associated with this SDG. Method accuracy and precision were assessed based on the blank spike/blank spike duplicate results. No qualifications were required.

## 2.8 SAMPLE CLEANUP PERFORMANCE

According to the laboratory extraction benchsheets, no cleanups were performed on the water samples. No qualifications were required.

## 2.9 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Field Blanks and Equipment Rinsates

There were no field QC samples associated with the sample in this SDG. No qualifications were required.

### 2.9.2 Field Duplicates

There were no field duplicate samples associated with the sample in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for pesticide target compounds and PCBs by EPA Method 608. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for the sample in this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified for this SDG; however, as there were no detects reported in the sample, quantitation was verified by recalculating a representative number of blank spike and surrogate recoveries. Reporting limits were supported by the low level standard

DATA VALIDATION REPORT

Project: NPDES  
SDG: IOB1014  
Analysis: Pest/PCB

of the initial calibrations and the laboratory MDL studies. The water reporting limits were not adjusted for sample amount on the result summaries; however, the dilution factor listed on the summaries reflected the sample volume extracted. Results were reported in ug/L (ppb). No qualifications were required.

Package ID T711RA4  
Task Order 313150010  
SDG No. Multiple  
No. of Analyses 11

Laboratory Del Mar  
Reviewer P. Meeks  
Analysis/Method Radionuclides

Date: 03/24/05  
Reviewer's Signature  
P. Meeks

ACTION ITEMS <sup>a</sup>	
1. Case Narrative Deficiencies	
2. Out of Scope Analyses	
3. Analyses Not Conducted	
4. Missing Hardcopy Deliverables	
5. Incorrect Hardcopy Deliverables	
6. Deviations from Analysis Protocol, e.g., Holding Times GC/MS Tune/Inst. Performance Calibrations Blanks Surrogates Matrix Spike/Dup LCS Field QC Internal Standard Performance Compound Identification and Quantitation System Performance	Qualifications applied for: 1. Exceeded holding times. 2. Matrix spike recovery outlier. 3. Laboratory duplicate RPD outlier. 4. Incorrect sample container. 5. Detector efficiency outliers. 6. Incorrect sample preservation. 7. Reanalysis rejected in favor of original result Three tritium results rejected due to incorrect sample preservation.
COMMENTS <sup>b</sup>	
<sup>a</sup> Subcontracted analytical laboratory is not meeting contract and/or method requirements.	
<sup>b</sup> Differences in protocol have been adopted by the laboratory but no action against the laboratory is required.	

## Data Qualifier Reference Table

Qualifier	Organics	Inorganics
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.	The associated value is an estimated quantity.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.	Not applicable.
UJ	The analyte was not deemed above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and to meet quality control criteria. The presence or absence of the analyte cannot be verified.	The data are unusable. (Note: Analyte may or may not be present).

## Qualification Code Reference Table

Qualifier	Organics	Inorganics
H	Holding times were exceeded.	Holding times were exceeded.
S	Surrogate recovery was outside QC limits.	The sequence or number of standards used for the calibration was incorrect
C	Calibration %RSD or %D were noncompliant.	Correlation coefficient is <0.995.
R	Calibration RRF was <0.05.	%R for calibration is not within control limits.
B	Presumed contamination from preparation (method) blank.	Presumed contamination from preparation (method) or calibration blank.
L	Laboratory Blank Spike/Blank Spike Duplicate %R was not within control limits.	Laboratory Control Sample %R was not within control limits.
Q	MS/MSD recovery was poor or RPD high.	MS recovery was poor.
E	Not applicable.	Duplicates showed poor agreement.
I	Internal standard performance was unsatisfactory.	ICP ICS results were unsatisfactory.
A	Not applicable.	ICP Serial Dilution %D were not within control limits.
M	Tuning (BFB or DFTPP) was noncompliant.	Not applicable.
T	Presumed contamination from trip blank.	Not applicable.
+	False positive – reported compound was not present. Not applicable.	
-	False negative – compound was present but not reported.	Not applicable.
F	Presumed contamination from FB, or ER.	Presumed contamination from FB or ER.
\$	Reported result or other information was incorrect.	Reported result or other information was incorrect.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis with this flag should not be used because another more technically sound analysis is available.	The analysis with this flag should not be used because another more technically sound analysis is available.
P	Instrument performance for pesticides was poor.	Post Digestion Spike recovery was not within control limits.
DNQ	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.	The compound was detected between the MDL and the RL and, by definition, is considered an estimated value.

\*#

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

Unusual problems found with the data that have been described in Section 2.#, "Data Validation Findings." The number following the asterisk (\*) will indicate the subsection where a description of the problem can be found (eg. \*1 would indicate a sample was not within temperature limits).

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB0418, IOB0980, IOB0993, IOB0996, IOB0997,  
IOB1001, IOB1004, IOB1014, & IOB1069  
Project Manager: P. Costa  
Matrix: Water/Soilid  
Analysis: Radionuclides  
QC Level: Level IV  
No. of Samples: 13  
No. of Reanalyses/Dilutions: 5  
Reviewer: P. Meeks  
Date of Review: March 23, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *EPA Prescribed Procedures for Measurements of Radioactivity in Drinking Water, Methods 900.0, 905.0, and 906.0*, and validation procedures outlined in the *USEPA CLP National Functional Guidelines for Inorganic Data Review (2/94)*. Any deviations from these procedures and guidelines are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

Following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

Most samples in these SDGs were received at Del Mar Analytical within the temperature limits of  $4\pm 2^{\circ}\text{C}$ . Eberline, the subcontract laboratory, did not provide sample receipt temperature information; however, as it is not necessary to chill radiological samples, no qualifications were required. All samples were received intact and in good condition.

According to the Eberline login sheet, Outfall 002 was received unpreserved. It was confirmed in correspondence with Eberline dated 01/31/05, that the gross alpha, gross beta, and strontium samples were not preserved upon receipt. The gross alpha, gross beta, and strontium results were not qualified for lack of preservation, as the method also specifies a five-day holding time for unpreserved samples.

Eberline noted on their login sheets that Outfall 007, Outfall 008, Outfall 009 and Outfall 010 were received preserved, in plastic containers. The method states that tritium samples should not be preserved. Per a telephone conversation with M. Mannion of Eberline, these samples were adjusted back to a pH of about 7 upon receipt at Eberline. Due to the improper pH adjustments, the tritium results for Outfall 007, Outfall 008, Outfall 009, and Outfall 010 were rejected, "R." Del Mar Analytical sent additional aliquots of Outfall 007, Outfall 008, Outfall 009, and Outfall 010 for tritium reanalyses. These samples were received in the proper containers and were not preserved.

Additionally, according to the Los Angeles Regional Water Quality Control Board's guidance letter dated 01/12/05, samples collected for tritium analysis should be submitted in glass containers to avoid potential loss of tritium by sorption onto the plastic container. As the Outfall 007, Outfall 008, Outfall 009 and Outfall 010 tritium analyses were previously rejected, no further qualifications were required.

After all analyses were complete, Del Mar Analytical sent extra volume of Outfall 001 to Eberline for gross alpha reanalysis and radium-228 and radium-226 analyses. Extra volume of Outfall 011 (IOB1004 and IOB1014) was sent to Eberline for radium-228 and radium-226 analyses. These aliquots were received properly preserved. The radium-226 and radium-228 results for Outfall 003 Unfiltered and Outfall 011 Unfiltered (IOB1014) were not preserved and were not qualified for lack of preservation, as the methods specify a five-day holding time for unpreserved samples.

Additionally, per a request from Del Mar Analytical (see section 2.1.2), Eberline filtered and then preserved radium-226 and radium-228 aliquots for Outfall 003 Filtered and gross alpha, gross beta, and strontium aliquots for Outfall 011 Filtered (IOB1014). No further qualifications were required.

#### 2.1.2 Chain of Custody

The original COCs were signed and dated by field and laboratory personnel and the transfer COCs were signed by personnel from both laboratories.

Filtered, unfiltered, and substrate analyses were requested for Outfall 011 (IOB1014) on the original COC from the field to Del Mar. These instructions did not appear on the transfer COC to Eberline and subsequently only unfiltered analyses were originally performed. Extra volume of Outfall 011 (IOB1014) was sent by Del Mar Analytical (see section 2.1.1) for the filtered and substrate analyses. The results are reported as Outfall 011 Filtered (IOB1014) and Outfall 011 Substrate (IOB1014).

The remaining original and transfer COCs accounted for the samples and analyses presented in this data package. Eberline did not list the MWH IDs on the Form Is; therefore, the reviewer edited the Form Is to reflect these IDs. A gross alpha was reanalysis was requested for Outfall 001, and tritium reanalysis were requested for Outfall 007, Outfall 008, Outfall 009, and Outfall 010. To distinguish between the original and reanalysis results, the reviewer added an "RE1" suffix to the original MWH and Del Mar Analytical IDs. No qualifications were required.

### 2.1.3 Holding Times

The tritium and cesium analyses were analyzed within 180 days of collection. The Outfall 002 gross alpha, gross beta, and strontium, Outfall 003 Unfiltered gross alpha, gross beta, strontium, radium-226, and radium-228, and Outfall 011 Unfiltered (IOB1014) gross alpha, gross beta, strontium, radium-226, and radium-228 samples were analyzed beyond the five day holding time for unpreserved samples; therefore, these results were qualified as estimated, "J," for detects and, "UJ," for nondetects. As the Outfall 011 Filtered (IOB1014) aliquots for gross alpha, gross beta, radium 226, radium 228, and strontium aliquots were preserved more than five days after collection, these nondetected results were qualified as estimated, "UJ." No further qualifications were necessary.

## 2.2 CALIBRATION

The laboratory calibration information included the standard certificates and applicable preparation/dilutions logs for NIST-traceability.

### Gross Alpha

The initial calibration included with the data was performed in February 2003. All detector efficiencies were below 20%; therefore, the gross alpha results were qualified as estimated, "UJ," for nondetects and, "J," for detects, unless otherwise rejected (see section 2.10).

### Gross Beta

The initial calibrations were performed in June 1997. All gross beta detector efficiencies were at least 20% and were considered acceptable.

### Tritium

No calibration standards were analyzed for this method. According to the laboratory, every sample was spiked for efficiency determination; therefore, no calibration is necessary. All detector efficiencies in the samples were at least 20% and were considered acceptable. All internal spike efficiency to default efficiency ratios were near 1, indicating that quenching did not occur.

### Strontium-90

The initial calibrations were performed in June 1997. All strontium chemical yields were at least 65% and were considered acceptable and the strontium continuing calibration results were within the laboratory control limits. No qualifications were necessary.

### Cesium

The reviewer confirmed that the 662 KeV peak was used for quantitation, with an efficiency of 85%. No qualifications were necessary.

### Radium

The radium-226 cell efficiencies were determined in May 2004. The radium-226 continuing calibration results were within the laboratory-established control limits. The radium-228 calibration utilized actinium-228 and was verified in February 2001 or June 2003. The radium-228 tracer, barium-133, was calibrated in March 2004. The tracer chemical yields were greater than 70%, and the actinium chemical yields were greater than 50%. No qualifications were necessary.

## **2.3 BLANKS**

No measurable activities were detected in the method blanks; therefore, no qualifications were necessary.

## **2.4 BLANK SPIKES AND LABORATORY CONTROL SAMPLES**

Blank spikes were analyzed in association with the samples in these SDGs. For one blank spike, the gross alpha, gross beta, and strontium recoveries were outside of the 3-sigma limits, but all had acceptable recoveries of 80%, 88%, and 108%, respectively. One radium-228 blank spike was recovered outside of the 3-sigma limits, but had an acceptable recovery of 125%. The remaining blank spike results were within the 3-sigma limits. No qualifications were necessary.

## **2.5 LABORATORY DUPLICATES**

The laboratory performed duplicate analyses for gross alpha, gross beta, tritium, and strontium on Outfall 002, Outfall 007, tritium on Outfall 007 RE1, radium-226 and radium-228 on Outfall 011 (IOB1004), for radium 226 on Outfall 011 Filtered, and cesium on Outfall 003 Substrate. The gross alpha and tritium RPDs were greater than 20% for Outfall 007. The gross alpha results were within 3-sigma and were considered acceptable, but the tritium result was just above 3-sigma; however, as no associated tritium detects were retained (see section 2.1.1), no qualifications were required. The remaining RPD were  $\leq 20\%$ . No qualifications were necessary.

## **2.6 MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

The laboratory performed matrix spike analyses for gross alpha, gross beta, and tritium on Outfall 002 and Outfall 007, for tritium on Outfall 007 RE1, and for radium 226 on Outfall 011 Filtered (IOB1014). The Outfall 002 recovery for gross alpha was below 3-sigma; therefore, the gross alpha results in Outfall 001, Outfall 002, Outfall 008, Outfall 009, Outfall 010, Outfall 011 Unfiltered (IOB1014), Outfall 011 (IOB1004), Outfall 003 Filtered, and Outfall 003 Unfiltered were qualified as estimated, "J," for detects and, "UJ," for nondetects. Outfall 007 was also analyzed with Outfall 002, however, as Outfall 007 had an acceptable recovery for gross alpha, no qualifications were applied. The remaining recoveries were within the 3-sigma limits. The radium 226 recovery for Outfall 011 Filtered

DATA VALIDATION REPORT

---

Project: NPDES  
SDG No.: Multiple  
Analysis: RAD

was outside the 3-sigma limit; therefore, nondetected radium 226 in Outfall 011 Filtered was qualified as estimated, "UJ." No further qualifications were necessary.

## 2.7 SAMPLE RESULT VERIFICATION

An EPA Level IV review was performed for the samples in these data packages. Sample results and MDAs reported on the sample result forms were verified against the raw data and no calculation or transcription errors were noted.

The original planchet for gross alpha in Outfall 001 was recounted once per a request from MWH personnel. The recount yielded a result equivalent to original count and was not reported. The sample was later reanalyzed from extra sample volume provided by Del Mar Analytical, and was reported as Outfall 001 RE1. As the two gross alpha results were similar, the reviewer rejected, "R," the reanalysis, Outfall 001 RE1, in favor of the original result, Outfall 001. No further qualifications were necessary.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based only on laboratory blanks. Any remaining detects are used to evaluate the associated samples.

### 2.8.1 Field Blanks and Equipment Rinsates

The samples in these SDGs had no associated field QC samples. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples in these SDGs.

Reviewer: M. Pokorny  
Date of Review: April 4, 2005

The samples listed in Table 1 were validated based on the guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Semivolatile Organics (DVP-3, Rev. 2)*, *EPA Method 625*, and the *National Functional Guidelines For Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The sample in this SDG was received at the laboratory within the temperature limits of 4°C ±2°C. The analysis did not require preservation, and no preservation was noted in the field. The COC noted that the sample was received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. The COC accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The water sample was extracted within seven days of collection and analyzed within 40 days of collection. No qualifications were required.

### 2.2 GC/MS TUNING

The DFTPP tunes met the criteria specified in Method 625, and the sample was analyzed within 12 hours of the DFTPP injection time. No qualifications were required.

### 2.3 CALIBRATION

The initial calibration associated with this SDG was dated 02/17/05. The average RRFs for were  $\geq 0.05$  and the %RSDs were  $\leq 35\%$  or  $r^2 \geq 0.995$  for all target compounds except for the  $r^2$  values for 2,4-dinitrophenol, 4-nitroaniline, and 4,6-dinitro-2-methylphenol. 2,4-Dinitrophenol, 4-nitroaniline, and 4,6-dinitro-2-methylphenol were qualified as estimated nondetects, "UJ," in the sample of this SDG. A representative number of average RRFs and %RSDs were checked from the raw data, and no calculation or transcription errors were noted. The continuing calibration associated with the sample analysis was analyzed 02/18/05. The RRFs for all target compounds were  $\geq 0.05$ , and the %Ds were  $\leq 20\%$ , except for the %Ds for NDMA, benzoic acid, and 4-nitrophenol. NDMA, benzoic acid, and 4-nitrophenol were qualified as estimated nondetects, "UJ," in the sample of this SDG. A representative number of RRFs,  $r^2$  values, and %Ds were checked from the raw data, and no calculation or transcription errors were noted. No further qualifications were required.

### 2.4 BLANKS

One method blank (5B14010-BLK1) was extracted and analyzed with this SDG. Fluorene, 2-methylnaphthalene, naphthalene, and phenanthrene were reported in the method blank at concentrations less than the reporting limits; however, the sample of this SDG did not have any

target compound detects. Review of the raw data indicated no reportable false negatives or false positives. No qualifications were required.

## 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One blank spike/ blank spike duplicate pair (5B14010-BS1/BSD1) was extracted and analyzed with this SDG. For blank spike/blank spike duplicate pairs, qualifications are applied, if necessary, to the associated samples based on those recoveries consistently outside of the laboratory-established QC limits in both the blank spike and blank spike duplicate. Results for those compounds with recoveries not consistent within the pair, with RPDs above the QC limit, are qualified as estimated, "UJ," for nondetects, and "J," for detects, in the associated samples. All percent recoveries and RPDs were within the laboratory QC limits except for benzidine. Benzidine was not recovered in the BSD and its RPD exceeded the control limit. The RPD for NDMA exceeded the control limit. The sample of this SDG had benzidine and NDMA qualified as estimated nondetects, "UJ." A representative number of recoveries and RPDs were calculated from the raw data and no calculation or transcription errors were found. No further qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample surrogate recoveries were within the laboratory QC limits. A representative number of recoveries were calculated from the raw data, and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

No MS/MSD analyses were associated with this SDG. Evaluation of method accuracy and precision was based on blank spike/blank spike duplicate results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. Following are findings associated with field QC samples:

### 2.8.1 Field Blanks and Equipment Rinsates

There were no field QC samples associated with this SDG. No qualifications were required.

### 2.8.2 Field Duplicates

There were no field duplicate samples associated with this SDG. No qualifications were required.

## 2.9 INTERNAL STANDARDS PERFORMANCE

The internal standard area counts and retention times were within the control limits established by the continuing calibration standards: -50%/+100% for internal standard areas and  $\pm 30$  seconds for retention times. A representative number of recoveries were checked from the raw data, and no transcription or calculation errors were noted. No qualifications were required.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for the semivolatile target compounds by EPA Method 625. Review of the sample chromatogram, retention times, and spectra indicated no problems with target compound identification. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification is verified at a Level IV data validation. No calculation or transcription errors were found. The reporting limits were supported by the low level of the initial and the method detection limit study. No qualifications were required.

## 2.12 TENTATIVELY IDENTIFIED COMPOUNDS

TICs were not reported by the laboratory for this SDG. No qualifications were required.

## 2.13 SYSTEM PERFORMANCE

Review of the raw data indicated no problems with system performance. No qualifications were required.

NPDES Monitoring

ANALYSIS: Total Petroleum Hydrocarbons: Purgeable

SAMPLE DELIVERY GROUP: IOB1014

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB1014  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: TPH-Purgeable  
QC Level: Level IV  
No. of Samples: 2  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: April 6, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Extractable Total Fuel Hydrocarbons by GC (DVP-8, Rev. 2)*, USEPA SW-846 Method 8015M, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

**Table 1. Sample identification**

Client ID	EPA ID	Lab No.	Matrix	Method

Trip Blank	Trip Blank	IOB1014-02	water	8015M/GRO

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The samples in this SDG were received at Del Mar Analytical laboratory on ice within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ , at  $4^{\circ}\text{C}$ . The Del Mar Analytical case narrative noted that the samples were received intact, and the COC indicated the samples were properly preserved. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel. As the samples were couriered directly to the laboratory, custody seals were not required. The TPH-GRO analysis was not requested on the COC for the trip blank sample; however, as the laboratory analyzed the trip blank and included it in the data package, the analysis was validated. No qualifications were required.

#### 2.1.3 Holding Times

The water samples were analyzed within 14 days of collection. No qualifications were required.

### 2.2 CALIBRATION

One gasoline standard initial calibration dated 08/20/04 was associated with the sample analyses. The %RSD for GRO (C4-C12) was within the QC limit of  $\leq 20\%$ . An initial calibration verification (ICV) was not provided in the data package. The %Ds for all CCVs bracketing the sample analyses were within the Method QC limit of  $\leq 15\%$ . The %RSD and %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.4 METHOD BLANKS

One water method blank (5B22003-BLK1) was associated with the sample analyses. GRO (C4-C12) was not detected above the MDL in the method blank. Review of the raw data indicated no false negative result. No qualifications were necessary.

### 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One water method blank spike (5B22003-BS1) was associated with the sample analyses. GRO (C4-C12) was recovered within the laboratory-established QC limits of 70-140% in the blank spike.

The recovery was checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The samples were fortified with the surrogate compound 4-bromofluorobenzene (BFB). Surrogate recoveries were within the laboratory-established QC of 65-140% for both samples. Recoveries were calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were not performed on the site sample in this SDG; therefore, evaluation of method accuracy was based on the blank spike results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Trip Blanks, Field Blanks, and Equipment Rinsates

Sample Trip Blank was the trip blank associated with site sample Outfall 011. GRO (C4-C12) was not detected above the MDL in the trip blank. Review of the raw data indicated no false negative result. There were no field blank or equipment rinsate samples associated with this SDG. No qualifications were necessary.

### 2.9.2 Field Duplicates

There were no field duplicate samples in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for GRO (C4-C12) by EPA SW-846 Method 8015M. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for the samples in this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantification was verified for this SDG by recalculating any sample detects, blank spike recoveries, and a representative number of surrogate recoveries. Reporting limits were supported by the low level standard of the initial calibrations and by the laboratory MDL. No qualifications were required.

# DATA VALIDATION REPORT

NPDES Monitoring

ANALYSIS: TPH/EXTRACTABLE

SAMPLE DELIVERY GROUP: IOB1014

Prepared by

AMEC Denver Operations  
550 South Wadsworth Boulevard, Suite 500  
Lakewood, Colorado 80226

## 1. INTRODUCTION

Task Order Title: NPDES Monitoring  
Contract Task Order #: 313150010  
SDG#: IOB1014  
Project Manager: B. McIlvaine  
Matrix: Water  
Analysis: TPH-Extractable  
QC Level: Level IV  
No. of Samples: 1  
No. of Reanalyses/Dilutions: 0  
Reviewer: L. Calvin  
Date of Review: April 6, 2005

The samples listed in Table 1 were validated based on the general guidelines outlined in the *AMEC Data Validation Procedure for Levels C and D Extractable Total Fuel Hydrocarbons by GC (DVP-8, Rev. 2)*, USEPA SW-846 Method 8015M, and validation guidelines outlined in the *USEPA CLP National Functional Guidelines for Organic Data Review (2/94)*. Any deviations from these procedures are documented herein. Qualifiers were applied in cases where the data did not meet the required QC criteria or where special consideration by the data user is required. Data qualifiers were placed on Form Is with the associated qualification codes. Analytes that were rejected for any reason are denoted on the Form I as having only the "R" data qualifier and associated qualification code(s) denoting the reason for rejection. Any additional problems with the data that may have resulted in an estimated value were not denoted by a qualification code since the data had already been rejected.

## 2. DATA VALIDATION FINDINGS

### 2.1 SAMPLE MANAGEMENT

The following are findings associated with sample management:

#### 2.1.1 Sample Preservation, Handling, and Transport

The sample in this SDG was received at Del Mar Analytical laboratory on ice within the temperature limits of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The Del Mar Analytical case narrative noted that the sample containers were received intact. No qualifications were required.

#### 2.1.2 Chain of Custody

The COC was signed and dated by both field and laboratory personnel, and accounted for the analysis presented in this SDG. As the sample was couriered directly to the laboratory, custody seals were not required. No qualifications were required.

#### 2.1.3 Holding Times

The sample was extracted within seven days of sample collection and analyzed within 40 days of extraction. No qualifications were required.

### 2.2 CALIBRATION

The initial calibration associated with the sample analysis was analyzed on 02/08/05. The %RSD was within the QC limit of  $\leq 20\%$ . The %Ds for the initial calibration verification (ICV) and continuing calibrations associated with the sample analysis were  $\leq 15\%$ . The %RSD and %Ds were recalculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

### 2.4 METHOD BLANKS

One method blank (5B19002-BLK1) was extracted and analyzed with the sample in this SDG. EFH (C13-C22) was not present above the MDL in the method blank or in the instrument blank analyzed at the beginning of the analytical sequence. Review of the chromatograms showed no false negatives. No qualifications were required.

### 2.5 BLANK SPIKES AND LABORATORY CONTROL SAMPLES

One method blank spike/blank spike duplicate pair (5B19002-BS1/BSD1) was extracted and analyzed with the sample in this SDG. The recoveries of alkane range C13-C22 from spiked diesel were within the laboratory-established QC limits of 40-120%, and the RPD was within the QC limit of  $\leq 25\%$ . The recoveries and RPD were checked from the raw data, and no calculation or transcription errors were noted. No qualifications were required.

## 2.6 SURROGATE RECOVERY

The sample was fortified with the surrogate compound n-octacosane. The sample surrogate recovery was within the laboratory-established QC of 40-125%. The recovery was calculated from the raw data and no transcription or calculation errors were noted. No qualifications were required.

## 2.7 MATRIX SPIKE/MATRIX SPIKE DUPLICATE

There were no MS/MSD analyses associated with the sample of this SDG. Evaluation of method accuracy and precision was based on the BS/BSD results. No qualifications were required.

## 2.8 FIELD QC SAMPLES

Field QC samples are evaluated, and if necessary, qualified based on method blanks and laboratory QC samples for usability. Any remaining detects are used to evaluate the associated samples. The following are findings associated with field QC samples:

### 2.9.1 Field Blanks and Equipment Rinsates

There were no field blank or equipment rinsate samples associated with the site sample in this SDG. No qualifications were required.

### 2.9.2 Field Duplicates

There were no field duplicate samples associated with the samples in this SDG.

## 2.10 COMPOUND IDENTIFICATION

The laboratory analyzed for EFH n-alkane range C13-C22 by EPA SW846 Method 8015M. Compound identification is verified at a Level IV validation. Review of chromatograms and retention times indicated no problems with compound identification for this SDG. No qualifications were required.

## 2.11 COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS
