After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.
Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Project/Site: CH661 / 692670.61.SW

Job ID: 570-25593-2

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Narrative
570-25593-2

Comments

No additional comments.

Receipt

The sample was received on 4/10/2020 6:00 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4° C.

Lab Admin

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract Work

Method EPA 1613B - Dioxins/Furans - Report with J - Level IV: This method was subcontracted to Cape Fear Analytical, LLC. The subcontract laboratory certification is different from that of the facility issuing the final report.

Accreditation/Certification Summary

Client: Jacobs Engineering Group, Inc.
Project/Site: CH661 / 692670.61.SW

Job ID: 570-25593-2

Laboratory: Eurofins Calscience

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Subcontract Data

April 30, 2020

Mr. Virendra Patel
Eurofins Calscience LLC
7440 Lincoln Way
Garden Grove, California 92841-1432

Re: Stormwater RFP Boeing SSFL MECX DXN
Work Order: 16430
SDG: 570-25593

Dear Mr. Patel:

Cape Fear Analytical LLC (CFA) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on April 14, 2020. This original data report has been prepared and reviewed in accordance with CFA's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at 910-795-0421 Ext. 2.

Sincerely,

Cynde Larkins
Project Manager

Purchase Order: 570-25593

12	COC form is properly signed in relinquished/received sections?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

Comments:

High Resolution Dioxins and Furans Analysis

Case Narrative

**HDOX Case Narrative
Eurofins Calscience (CALs)
SDG 570-25593
Work Order 16430**

Method/Analysis Information

Product: Dioxins/Furans by EPA Method 1613B in Liquids
Analytical Method: EPA Method 1613B
Extraction Method: SW846 3520C
Analytical Batch Number: 43611
Clean Up Batch Number: 43606
Extraction Batch Number: 43605

Sample Analysis

Sample 16430001 was received at 3.9°C. The following samples were analyzed using the analytical protocol as established in EPA Method 1613B:

Sample ID	Client ID
12026457	Method Blank (MB)
12026458	Laboratory Control Sample (LCS)
12026459	Laboratory Control Sample Duplicate (LCSD)
16430001	A2BMP0006S011 (570-25593-1)

The samples in this SDG were analyzed on an "as received" basis.

SOP Reference

Procedure for preparation, analysis and reporting of analytical data are controlled by Cape Fear Analytical LLC (CFA) as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with CF-OA-E-002 REV# 15.

Raw data reports are processed and reviewed by the analyst using the TargetLynx software package.

Calibration Information

Initial Calibration

All initial calibration requirements have been met for this sample delivery group (SDG).

Continuing Calibration Verification (CCV) Requirements

All associated calibration verification standard(s) (CCV) met the acceptance criteria.

Quality Control (QC) Information

Certification Statement

The test results presented in this document are certified to meet all requirements of the 2009 TNI Standard.

Method Blank (MB) Statement

The MB(s) analyzed with this SDG met the acceptance criteria.

Surrogate Recoveries

All surrogate recoveries were within the established acceptance criteria for this SDG.

Laboratory Control Sample (LCS) Recovery

The LCS spike recoveries met the acceptance limits.

Laboratory Control Sample Duplicate (LCSD) Recovery

The LCSD spike recoveries met the acceptance limits.

LCS/LCSD Relative Percent Difference (RPD) Statement

The RPD(s) between the LCS and LCSD met the acceptance limits.

QC Sample Designation

A matrix spike and matrix spike duplicate analysis was not required for this SDG.

Technical Information

Holding Time Specifications

CFA assigns holding times based on the associated methodology, which assigns the date and time from sample collection. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

Preparation/Analytical Method Verification

All procedures were performed as stated in the SOP.

Sample Dilutions

The samples in this SDG did not require dilutions.

Sample Re-extraction/Re-analysis

Re-extractions or re-analyses were not required in this SDG.

Miscellaneous Information

Nonconformance (NCR) Documentation

A NCR was not required for this SDG.

Manual Integrations

Certain standards and QC samples required manual integrations to correctly position the baseline as set in the calibration standard injections. Where manual integrations were performed, copies of all manual integration peak profiles are included in the raw data section of this fraction. Manual integrations were required for data files in this SDG.

System Configuration

This analysis was performed on the following instrument configuration:

Instrument ID	Instrument	System Configuration	Column ID	Column Description
HRP750_2	Primary Dioxin Analysis	Dioxin Analysis	DB-5MS	60m x 0.25mm, 0.25um

Electronic Packaging Comment

This data package was generated using an electronic data processing program referred to as virtual packaging. In an effort to increase quality and efficiency, the laboratory has developed systems to generate all data packages electronically. The following change from traditional packages should be noted: Analyst/peer reviewer initials and dates are not present on the electronic data files. Presently, all initials and dates are present on the original raw data. These hard copies are temporarily stored in the laboratory. An electronic signature page inserted after the case narrative will include the data validator's signature and title. The signature page also includes the data qualifiers used in the fractional package. Data that are not generated electronically, such as hand written pages, will be scanned and inserted into the electronic package.

Sample Data Summary

Cape Fear Analytical, LLC

3306 Kitty Hawk Road Suite 120, Wilmington, NC 28405 - (910) 795-0421 - www.capefearanalytical.com

Certificate of Analysis Report for

CALS001 Eurofins Calscience

Client SDG: 570-25593 CFA Work Order: 16430

The Qualifiers in this report are defined as follows:

- * A quality control analyte recovery is outside of specified acceptance criteria
- ** Analyte is a surrogate compound
- B The target analyte was detected in the associated blank.
- J Value is estimated
- K Estimated Maximum Possible Concentration
- U Analyte was analyzed for, but not detected above the specified detection limit.

Review/Validation

Cape Fear Analytical requires all analytical data to be verified by a qualified data reviewer.

The following data validator verified the information presented in this case narrative:

Signature: 

Name: Heather Patterson

Date: 30 APR 2020

Title: Group Leader

Note: Since laboratory accreditations are subject to change, Eurofins Calscience places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/matrix being analyzed, the samples must be shipped back to the Eurofins Calscience laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Calscience attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Calscience.

After printing this label:
1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.
Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-255230-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (but with no number) upon receipt at TA-Sacramento.
- A field blank on the COC, FB_20191120, was listed on a hold status and was not analyzed. The narrative noted that although the COC listed two sample containers, one one-liter amber glass bottle was received.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^x reviewed the SDG on June 9, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8-HxCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, 2,3,7,8-TCDF, OCDD and OCDF, and for all totals except PeCDD and PeCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The method blank concentrations were not sufficient to qualify results above the RLs. Total detects for HpCDD, HpCDF, HxCDD, HxCDF, TCDD and TCDF were qualified as estimated (J), as only a portion of the totals was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Sample FB_20191120 associated with the site samples in this SDG was listed on a hold status on the COC and was not analyzed. Equipment blank samples were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis was performed for isomer 2,3,7,8-TCDF detected in the initial analyses of samples B1BMP0009_20191120 and ILBMP0010_20191120. The result in sample B1BMP0009_20191120 was confirmed and the result in sample ILBMP0010_20191120 was not confirmed. As the confirmation column is more specific for the detection of 2,3,7,8-TCDF, the initial results were rejected (R) as duplicate data in favor of the confirmation results.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHODS 200.8 AND 245.1— METALS AND MERCURY

M. Hilchey of MEC^x reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Methods 245.1 and 200.8* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were filtered and preserved within 24 hours of receipt, as required on the COC.

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on B1BMP0009_20191120 (total) and B1BMP0010_20191120 (dissolved) for Method 200.8 and on samples B1BMP0009_20191120 (total) and ILBMP0010_20191120 (dissolved) for Method 245.1. Recoveries were within the QAPP control limits of 70-130% for all target analytes and RPDs were $\leq 20\%$.

IV.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. FIELD DUPLICATES

There were no field duplicate samples identified for this SDG.

Validated Sample Result Forms: 4402552301

Analysis Method E1613B

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-255714-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The sample was transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento; however, the seal had no number.
- The case narrative noted the collection times listed on the containers for the following samples did not match those on the COC: B1BMP0011_20191127, ILBMP0005_20191127, LPBMP0002_20191127, LPBMP0002_20191127 and LPBMP0003_20191127. The samples were logged per the COC.
- An equipment blank listed on the COC for Method 1613B analysis, EB_20191127, was not provided in the data package.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^x reviewed the SDG on June 9, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD and OCDF, and for total HpCDD. OCDD was detected above the RL in the method blank. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. All results above the RL and less than 10× the amount in the blank for OCDD were qualified as as nondetects (U) in samples LPBMP0002_20191127, LPBMP0003_20191127 and LPBMP0004_20191127. The method blank concentrations were not sufficient to qualify remaining results above the RLs. Total detects for HpCDD were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

A field blank was not identified for this SDG. Equipment blank COC EB_20191127 listed on the COC, was not analyzed or provided in the data package.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis was performed for isomer 2,3,7,8-TCDF detected in the initial analyses of samples B1BMP0009_20191127, ILBMP0005_20191127 and LPBMP0002_20191127. None of the initial results were confirmed. As the confirmation column is more specific for the detection of 2,3,7,8-TCDF, the initial results were rejected (R) as duplicate data in favor of the confirmation results.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The total PeCDD result in sample B1BMP0009_20191127 and TCDD result in sample B1BMP0010_20191127 matched the associated qualified isomers and were also qualified as estimated nondetects (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHODS 200.8 AND 245.1— METALS AND METALS

M. Hilchey of MEC^x reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Methods 200.8 and 245.1* and the *National Functional Guidelines for Inorganic Method Data Review* (2017).

IV.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were not filtered and preserved within 24 hours of receipt at the laboratory, as required on the COC. The samples were filtered and preserved approximately 43 hours after receipt; therefore, all results for dissolved metals and mercury were qualified as estimated (J for detects; UJ for nondetects).

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample and laboratory control sample duplicate recoveries (total and dissolved) were within the QAPP control limits of 85-115%. RPDs, as applicable, were $\leq 20\%$.

IV.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on samples B1BMP0009_20191127 (dissolved) and B1BMP0011_20191127 (total) for Method 200.8, and on sample LPBMP0004_20191127 (dissolved) for Method 245.1. Recoveries were within the QAPP control limits of 70-130% for all target analytes. RPDs were $\leq 20\%$. MS/MSD analyses were not performed on a sample from this SDG for Method 245.1 (total)

IV.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. FIELD DUPLICATES

There were no field duplicate samples identified for this SDG.

I. INTRODUCTION

Task Order Title: Boeing SSFL NPDES

Contract: 40458-078 and 40458-083

MEC^x Project No.: 1272.003D.01 002

Sample Delivery Group: 440-255939-1

Project Manager: Katherine Miller

Matrix: Water

QC Level: II

No. of Samples: 2

No. of Reanalyses/Dilutions: 0

Laboratory: TestAmerica-Irvine

TABLE 1 - SAMPLE IDENTIFICATION

Sample Name	Lab Sample Name	Sub Lab Sample ID	Matrix	Collection	Method	Validation Level
ILBMP0009_20191128	440-255939-1	N/A	WM	11/28/19 7:50 AM	E1613B, E200.8, E245.1	II
ILBMP0010_20191128	440-255939-2	N/A	WM	11/28/19 8:00 AM	E1613B, E200.8, E245.1	II

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-255939-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (though without a number) upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^X reviewed the SDG on June 9, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD and OCDF, and for total HpCDD. OCDD was detected above the RL in the method blank. The isomer method blank concentrations were not sufficient to qualify sample results, all above the RL. Results for total HpCDD were qualified as estimated (J) as a portion of the total was considered possible method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blanks and equipment blanks were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not performed, as 2,3,7,8-TCDF was not detected in the initial analyses of the samples.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The total TCDD result in sample ILBMP0009_20191128 matched the associated qualified isomer and was also qualified as an estimated nondetect (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHODS 200.8 AND 245.1— METALS AND MERCURY

M. Hilchey of MEC^x reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Methods 200.8 and 245.1* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were filtered and preserved within 24 hours of receipt, as required on the COC.

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. **LABORATORY DUPLICATES:**

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. **MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

MS/MSD analyses were performed on sample ILBMP0009_20191128 (dissolved) for Method 200.8 and on sample ILBMP0010_20191128 (dissolved) for Method 245.1. Recoveries were within the QAPP control limits of 70-130% for all target analytes and RPDs were $\leq 20\%$. MS/MSD analyses were not performed on a sample in this SDG for either method for total metals.

IV.3.6. **SERIAL DILUTION**

Serial dilution analyses were not performed.

IV.4. **INTERNAL STANDARDS PERFORMANCE**

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. **COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS**

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. **FIELD QC SAMPLES**

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. **FIELD BLANKS AND EQUIPMENT BLANKS**

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. **FIELD DUPLICATES**

There were no field duplicate samples identified for this SDG.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklist and the chain-of-custody (COC) provided by the laboratory for sample delivery group (SDG) 440-256482-1:

- The laboratory received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratory received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

**TABLE 3 - REASON CODE REFERENCE**

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. METHODS 200.8 AND 245.1— METALS AND MERCURY

M. Hilchey of MEC^X reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Methods 200.8 and 245.1* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

III.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were not filtered and preserved within 24 hours of receipt at the laboratory, as required on the COC. The samples were filtered and preserved approximately 96 hours after receipt; therefore, all dissolved results were qualified as estimated (J for detects; UJ for nondetects).

III.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

III.3. QUALITY CONTROL SAMPLES

III.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

III.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

III.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

III.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

III.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on sample A1BMP0002_20191204 for Method 245.1 (dissolved only). Recoveries were within the QAPP control limits of 70-130%. The RPD was $\leq 20\%$. MS/MSD analyses were not performed on a sample from this SDG for the remaining analyses.

III.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

III.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

III.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

III.6. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.6.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.6.2. *FIELD DUPLICATES*

There were no field duplicate samples identified for this SDG.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-256482-2:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The sample was transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present (though with no number) upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^x reviewed the SDG on June 9, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF and OCDD, and for totals HpCDD and HpCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The method blank concentration of OCDD was not sufficient to qualify the result above the RL in sample LLBMP0002_20191204. Total HpCDF in sample A1BMP0002_20191204 (containing both a qualified method blank isomer and a qualified EMPC isomer) was qualified as an estimated nondetect (UJ). Remaining total detects for HpCDD and HpCDF were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blanks and equipment blanks were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was not performed, as 2,3,7,8-TCDF was not detected in the initial analyses of the samples.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Total HpCDF in sample A1BMP0002_20191204 (containing both a qualified method blank isomer and a qualified EMPC isomer) was qualified as an estimated nondetect (UJ). The total HxCDD result in sample A1BMP0003_20191204 matched the sum of the associated qualified isomers and was also qualified as an estimated nondetect (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

I. INTRODUCTION

Task Order Title: Boeing SSFL NPDES

Contract: 40458-078 and 40458-083

MEC^X Project No.: 1272.003D.01 002

Sample Delivery Group: 440-258024-1

Project Manager: Katherine Miller

Matrix: Water

QC Level: II

No. of Samples: 4

No. of Reanalyses/Dilutions: 0

Laboratory: TestAmerica-Irvine

TABLE 1 - SAMPLE IDENTIFICATION

Sample Name	Lab Sample Name	Sub Lab Sample ID	Matrix	Collection	Method	Validation Level
LPBMP0002_20191223	440-258024-1	N/A	WM	12/23/19 6:50 AM	E1613B, E200.8, E245.1	II
LPBMP0003_20191223	440-258024-2	N/A	WM	12/23/19 7:00 AM	E1613B, E200.8, E245.1	II
LPBMP0004_20191223	440-258024-3	N/A	WM	12/23/19 7:10 AM	E1613B, E200.8, E245.1	II
EPSW002IE02_20191223	440-258024-4	N/A	WM	12/23/19 8:00 AM	E1613B, E200.8, E245.1	II

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-258024-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^X reviewed the SDG on June 10, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, OCDD and OCDF, and for totals HpCDD, HpCDF and HxCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. The method blank concentrations were not sufficient to qualify results above the RL in the samples. Total detects for HpCDD, HpCDF and HxCDD were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B, and RPDs were within the control limit of ≤50%.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blanks and equipment blanks were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis was performed for isomer 2,3,7,8-TCDF detected in the initial analysis of sample LPBMP0002_20191223. The initial result was not confirmed. As the confirmation column is more specific for the detection of 2,3,7,8-TCDF, the initial result was rejected (R) as duplicate data in favor of the confirmation result.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHODS 200.8 AND 245.1— METALS AND MERCURY

M. Hilchey of MEC^x reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Methods 200.8 and 245.1* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were filtered and preserved within 24 hours of receipt, as required on the COC.

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. **LABORATORY DUPLICATES:**

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. **MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

MS/MSD analyses were performed on sample EPSW002IE02_20191223 (dissolved only) for Method 200.8, and on sample LPBMP0002_20191223 (total and dissolved) for Method 245.1. Recoveries were within the QAPP control limits of 70-130% for all target analytes and RPDs were $\leq 20\%$. MS/MSD analyses were not performed on a sample in this SDG for total metals for Method 200.8.

IV.3.6. **SERIAL DILUTION**

Serial dilution analyses were not performed.

IV.4. **INTERNAL STANDARDS PERFORMANCE**

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. **COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS**

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. **FIELD QC SAMPLES**

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. **FIELD BLANKS AND EQUIPMENT BLANKS**

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. **FIELD DUPLICATES**

There were no field duplicate samples identified for this SDG.

Validated Sample Result Forms: 4402580241

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-258216-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^X reviewed the SDG on June 10, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8-HxCDD, 1,2,3,6,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 1,2,3,7,8,9-HxCDF, 2,3,4,6,7,8-HxCDF, OCDD and OCDF, and for all totals except PeCDD, PeCDF and TCDD. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. Results for total HxCDD in samples A1BMP0002_20191226, A1BMP0003_20191226, EPSW001IE01_20191226 and LXBMP0012_20191226 matched the sum of qualified isomers and were also qualified as nondetects (U). Results for total HxCDF in samples A1BMP0002_20191226, EPSW001IE01_20191226 and LXBMP0012_20191226 (containing both qualified method blank isomers and qualified EMPC isomers) were qualified as estimated nondetects (UJ). Remaining total detects for HpCDD, HpCDF, HxCDD, HxCDF and TCDF were qualified as estimated (J), as only a portion of the totals was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blanks and equipment blanks were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis was performed for isomer 2,3,7,8-TCDF detected in the initial analyses of samples A1BMP0003_20191226, EPSW001IE01_20191226 and LXBMP0012_20191226 were not confirmed. As the confirmation column is more specific for the detection of 2,3,7,8-TCDF, the initial results were rejected (R) as duplicate data in favor of the confirmation results.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, these samples had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Results for total HxCDF in samples A1BMP0002_20191226, EPSW001IE01_20191226 and LXBMP0012_20191226 (containing both qualified method blank isomers and qualified EMPC isomers) were qualified as estimated nondetects (UJ). Results for Total PeCDF and PeCDD in samples A1BMP0002_20191226 and A1BMP0003_20191226, total PeCDF in sample LXBMP0011_20191226, total PeCDD and TCDD in sample EPSW001IE01_20191226 and total TCDD in sample EPSW001BG01_20191226 were qualified as estimated nondetects (UJ) as the total results matched the sum of the isomer results qualified as EMPCs. Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHODS 200.8 AND 245.1— METALS AND MERCURY

M. Hilchey of MEC^X reviewed the SDG on June 1, 2020.

The samples listed in Table 1 for these analyses were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, EPA Methods 200.8 and 245.1 and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding times, 28 days for mercury and six months for metals, were met. The samples designated for dissolved metals analysis were filtered and preserved within 24 hours of receipt, as required on the COC.

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks (total and dissolved).

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on sample LXBMP0012_20191226 (total) for Method 200.8. Recoveries were within the QAPP control limits of 70-130% for all target analytes and RPDs were $\leq 20\%$. MS/MSD analyses were not performed on a sample from this SDG for the remaining analyses.

IV.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. FIELD DUPLICATES

There were no field duplicate samples identified for this SDG.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-262590-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^X reviewed the SDG on June 2, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HpCDD, HxCDD and HxCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. OCDD detected above the RL in sample ILBMP0005_20200310 was also qualified as a nondetect (U) at the level of contamination. Method blank concentrations were not sufficient to qualify remaining sample results above the RLs. Sample totals for HpCDD, HxCDD and HxCDF were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was performed for the initial detect in sample ILBMP0004_20200310, and both the initial and confirmation results were reported. The initial result was not confirmed; therefore, the initial result was rejected (R) as duplicate data in favor of the nondetect confirmation result.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. Concentrations of total TCDD in sample ILBMP0004_20200310 and total PeCDD in sample ILBMP0005_20200310 matched qualified isomers and were therefore also qualified as estimated nondetects (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHOD 200.8— METALS

M. Hilchey of MEC^x reviewed the SDG on May 27, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the *MEC^x Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Method 200.8* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding time, six months for metals, was met. Sample fractions designated for dissolved metals analysis were filtered at the laboratory approximately 2 hours past the COC requirement of within 24 hours of receipt. All dissolved metals results were qualified as estimated (J).

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks.

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICP-AES and ICP-MS ICSAB data are not evaluated for Stage II validation.

IV.3.3. **LABORATORY CONTROL SAMPLES**

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. **LABORATORY DUPLICATES:**

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. **MATRIX SPIKE/MATRIX SPIKE DUPLICATE**

MS/MSD analyses were performed on sample 1LBMP0004_20200310 (total and dissolved). Recoveries were within the QAPP control limits of 70-130%. RPDs were $\leq 20\%$.

IV.3.6. **SERIAL DILUTION**

Serial dilution analyses were not performed.

IV.4. **INTERNAL STANDARDS PERFORMANCE**

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. **COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS**

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. **FIELD QC SAMPLES**

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. **FIELD BLANKS AND EQUIPMENT BLANKS**

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. **FIELD DUPLICATES**

There were no field duplicate samples identified for this SDG.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-262973-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^X reviewed the SDG on June 2, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. METHOD BLANKS

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HpCDD, HxCDD and HxCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. Method blank concentrations were not sufficient to qualify sample results above the RLs. Sample totals for HpCDD, HxCDD and HxCDF were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. LABORATORY CONTROL SAMPLES

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was performed for the initial detect in sample EPSW001BG01_20200313, and both the initial and confirmation results were reported. The initial result was not confirmed; therefore, the initial result was rejected (R) as duplicate data in favor of the nondetect confirmation result.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The concentration of total PeCDD in sample ILBMP0002_20200312 matched the qualified isomer and was therefore also qualified as an estimated nondetect (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHOD 200.8— METALS

M. Hilchey of MEC^X reviewed the SDG on May 28, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Method 200.8* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding time, six months for metals, was met. The samples designated for dissolved metals analysis were filtered and preserved 68 hours after receipt, which exceeds the COC requirement of within 24 hours of receipt. All dissolved metals results for these samples were qualified as estimated (J for detects, UJ for nondetects).

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blanks.

IV.3.2. INTERFERENCE CHECK SAMPLES:

ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on sample EPSW001BG01_20200313 (total metals only). Recoveries were within the QAPP control limits of 70-130% for all target analytes. RPDs were $\leq 20\%$ for all target analytes. MS/MSD analyses were not performed on a sample in this SDG for dissolved metals.

IV.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. FIELD DUPLICATES

There were no field duplicate samples identified for this SDG.

V. VARIOUS METHODS — GENERAL CHEMISTRY

M. Hilchey of MEC^X reviewed the SDG on May 28, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the MEC^X *Data Validation Procedure for General Minerals (DVP-6, Rev. 1)*, *Standard Methods for the Examination of Water and Wastewater 2450D* and the *National Functional Guidelines for Inorganic Superfund Data Review (2017)*.

V.1. HOLDING TIMES

The QAPP holding time requirement, 7 days for Total Suspended Solids (TSS), was met.

V.2. CALIBRATION

Instrument calibration review is not performed at Level II validation.

V.3. QUALITY CONTROL SAMPLES

V.3.1. *METHOD BLANKS*

The method blank had no detections.

V.3.2. *LABORATORY CONTROL SAMPLES*

Laboratory control sample recovery was within the laboratory control limits.

V.3.3. *LABORATORY DUPLICATES*

Laboratory duplicate analyses were not performed on the sample in this SDG.

V.3.4. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE*

MS/MSD analysis is not applicable to this method.

V.4. SAMPLE RESULT VERIFICATION

Sample result verification is not performed at Level II validation. Reported nondetects are valid to the MDL.

V.5. FIELD QC SAMPLES

MEC^X evaluated field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site sample. Findings associated with field QC samples are summarized below.

V.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

V.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

I. INTRODUCTION

Task Order Title: Boeing SSFL NPDES

Contract: 40458-078 and 40458-083

MEC^x Project No.: 1272.003H.01

Sample Delivery Group: 440-262973-2

Project Manager: Katherine Miller

Matrix: Water

QC Level: II

No. of Samples: 3

No. of Reanalyses/Dilutions: 0

Laboratory: TestAmerica-Irvine

TABLE 1 - SAMPLE IDENTIFICATION

Sample Name	Lab Sample Name	Sub Lab Sample ID	Matrix	Collection	Method
EPSW001BG01_20200313	440-262973-4	N/A	WM	3/13/20 9:20 AM	E900

EPSW002IE02_20200313	440-262973-6	N/A	WM	3/13/20 9:40 AM	E900

II. SAMPLE MANAGEMENT

According to the case narrative, sample condition upon receipt forms and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-262973-2:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact.
- The sample containers were received improperly preserved at TA-SL. The appropriate containers were preserved to $\text{pH} \leq 2$ upon receipt.
- Field and laboratory personnel signed and dated the COCs.
- Sample containers were transferred to TestAmerica – St. Louis laboratory for all radionuclide analyses.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-SL.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For perchlorate, the associated value is the sample detection limit or the quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 900 —GROSS ALPHA

M. Hilchey of MEC^X reviewed the SDG on June 5, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the *EPA Method 900* and the *National Functional Guidelines for Superfund Inorganic Method Data Review (2017)*.

III.1. HOLDING TIMES:

According to the case narrative, the samples were received properly preserved (except as noted in the Sample Management section above) and holding time requirements were met.

III.2. CALIBRATION:

The detector efficiencies for gross alpha for all samples were less than 20%; therefore, the detected sample results for gross alpha were qualified as estimated with potentially low bias (J-) and the nondetected sample results were qualified as estimated (UJ).

III.3. QUALITY CONTROL SAMPLES

III.3.1. *METHOD BLANKS*

Gross alpha was not detected in the method blanks above the MDC. However, a comparison normalized absolute difference of the sample results and the method blank results indicated the method blank and the sample result was not significantly different at the 1% level of confidence for gross alpha-dissolved for sample EPSW0021E02_20200313. The associated result was qualified as nondetect (U). It should be noted that this result was previously qualified as J- (See Calibration section above); therefore, the ultimate qualifier for this result is UJ.

III.3.2. *LABORATORY CONTROL SAMPLES:*

The recoveries were within laboratory-established control limits.

III.3.3. *LABORATORY DUPLICATES:*

Laboratory duplicates were not performed on a sample from this SDG.

III.3.4. *MATRIX SPIKE/MATRIX SPIKE DUPLICATE:*

Matrix spike (MS)/MSD analyses were not performed on a sample from this SDG.

III.4. SAMPLE RESULT VERIFICATION:

An EPA Level II review was performed on the sample in this data package. Sample results are not verified at this level of validation. Reported nondetects are valid to the MDC.

III.5. FIELD QC SAMPLES:

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. The following are findings associated with field QC samples:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS:*

This SDG had no identified field blank or equipment blank samples.

III.5.2. **FIELD DUPLICATES:**

There were no field duplicate samples identified for this SDG.

II. SAMPLE MANAGEMENT

According to the case narrative, Login Sample Receipt Checklists and the chains-of-custody (COCs) provided by the laboratories for sample delivery group (SDG) 440-264190-1:

- The laboratories received the samples in this SDG on ice and within the temperature limits of ≤ 6 degrees Celsius ($^{\circ}\text{C}$) and $> 0^{\circ}\text{C}$.
- The laboratories received the sample containers intact and properly preserved, as applicable.
- Field and/or laboratory personnel signed and dated the original and transfer COCs.
- The samples were transferred from TA-Irvine to TA-Sacramento for analysis of Method 1613B, and to TA-STL for analysis of Method E900.
- According to the Login Sample Receipt Checklist, custody seals were absent on the coolers upon receipt at TA-Irvine. No evidence of tampering was noted. The Login Sample Receipt Checklist indicated a custody seal was present upon receipt at TA-Sacramento and TA-STL.

TABLE 2 - DATA QUALIFIER REFERENCE

Qualifier	Organics	Inorganics
U	The analyte was analyzed for but was not detected above the reported sample quantitation limit. For dioxins or PCB congeners, the associated value is the quantitation limit or the estimated detection limit.	The analyte was analyzed for but was not detected above the reported sample quantitation limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.	The analyte was analyzed for but was not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."	Not applicable.
NJ	The analyte has been "tentatively identified" or "presumptively" as present and the associated numerical value is the estimated concentration in the sample.	Not applicable.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.	The data are unusable. The sample results are rejected due to serious deficiencies in meeting quality control criteria. The analyte may or may not be present in the sample.

TABLE 3 - REASON CODE REFERENCE

Reason Code	Organic	Inorganic
H	Holding time was exceeded.	Holding time was exceeded.
S	Surrogate recovery was outside control limits.	The sequence or number of standards used for the calibration was incorrect.
C	Calibration percent relative standard deviation (%RSD) or percent deviation (%D) were noncompliant, or coefficient of determination (r^2) was <0.990.	Correlation coefficient (r) was <0.995.
R	Calibration relative response factor (RRF) was <0.05.	Percent recovery (%R) for calibration was outside control limits.
B	The analyte was detected in an associated blank as well as in the sample.	The analyte was detected in an associated blank as well as in the sample.
L	Laboratory control sample (LCS) or /LCS duplicate (LCSD) %R was outside the control limits.	LCS or LCSD %R was outside the control limits.
L1	LCS/LCSD relative percent difference (RPD) was outside the control limit.	LCS/LCSD RPD was outside the control limit.
Q	Matrix spike/matrix spike duplicate (MS/MSD) %R was outside control limits.	MS or MSD %R was outside the control limit.
Q1	MS/MSD RPD was outside the control limit.	MS/MSD RPD was outside the control limit.
E	Result was reported as an estimated maximum possible concentration (EMPC).	Laboratory duplicate RPD was outside the control limit.
I	Internal standard recovery was outside control limits.	Inductively coupled plasma (ICP) interference check standard (ICSA/ICSAB) result was outside control limits.
I1	Not applicable.	ICP mass spectrometer (ICPMS) internal standard recovery was outside control limits.
A	Not applicable.	Serial dilution %D was outside control limits.
M	Tuning (BFB or DFTPP) was not compliant.	ICPMS tune was not compliant.
T	The analyte was detected in an associated trip blank as well as in the sample.	Not applicable.

Reason Code	Organic	Inorganic
+	False positive – reported compound was not present.	False positive – reported compound was not present.
-	False negative – compound was present but not reported.	False negative – compound was present but not reported.
F	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.	The analyte was detected in an associated field blank (FB) or equipment blank (EB) as well as in the sample.
F1	Field duplicate RPD was outside the control limit.	Field duplicate RPD was outside the control limit.
§	The reviewer corrected the reported result and/or other information.	The reviewer corrected the reported result and/or other information.
?	TIC identity or reported retention time has been changed.	Not applicable.
D	The analysis was not used because another more technically sound analysis was available.	The analysis was not used because another more technically sound analysis was available.
P	Instrument performance not compliant.	Post digestion spike recovery was outside of control limits.
DNQ	The reported result is above the method detection limit but is less than the reporting limit.	The reported result is above the method detection limit but is less than the reporting limit.
*II, *III	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.	Other problems identified in the data are described in Section II, "Sample Management," or Section III, "Method Analyses." The number following the asterisk (*) will indicate the report section where a description of the problem can be found.

III. EPA METHOD 1613B — DIOXIN/FURANS

L. Calvin of MEC^x reviewed the SDG on June 3, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Dioxins and Furans* (DVP-19, Rev. 0), *USEPA Method 1613B* and the *National Functional Guidelines Chlorinated Dioxin/Furan Data Review* (2011).

III.1. HOLDING TIMES

Extraction and analytical holding times were met. The water samples were extracted and analyzed within one year of collection.

III.2. INSTRUMENT PERFORMANCE

Instrument performance criteria were not evaluated at a Stage II validation.

III.3. CALIBRATION

Calibration criteria were not evaluated at a Stage II validation.

III.4. QUALITY CONTROL SAMPLES

III.4.1. *METHOD BLANKS*

The method blank had detects above the EDL and below the reporting limit (RL) for isomers 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8-HxCDD, 1,2,3,7,8,9-HxCDD, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, OCDD and OCDF, and for totals HpCDD, HpCDF, HxCDD and HxCDF. The sample results for the isomer method blank contaminants detected below the RL were qualified as nondetects (U) at the level of contamination. OCDD detected above the RL in sample LXBMP0010_20200406 was also qualified as a nondetect (U) at the level of contamination. Total HxCDD in sample LXBMP0012_20200406 (containing both qualified method blank isomers and a qualified EMPC isomer) was qualified as an estimated nondetect (UJ). Remaining sample totals for HpCDD, HpCDF, HxCDD and HxCDF were qualified as estimated (J), as only a portion of the total was determined to be method blank contamination.

III.4.2. *LABORATORY CONTROL SAMPLES*

LCS recoveries were within the acceptance criteria listed in Table 6 of Method 1613B.

III.5. FIELD QC SAMPLES

MEC^x evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

III.5.1. *FIELD BLANKS AND EQUIPMENT BLANKS*

Field blank or equipment blank samples were not identified for this SDG.

III.5.2. *FIELD DUPLICATES*

Field duplicate samples were not identified in this SDG.

III.6. INTERNAL STANDARDS PERFORMANCE

The labeled standard recoveries were not evaluated at a Stage II validation.

III.7. COMPOUND IDENTIFICATION

Compound identification was not evaluated at a Stage II validation. Second-column confirmation analysis for isomer 2,3,7,8-TCDF was performed for the initial detect in sample EPSW002IE02_20200406, and both the initial and confirmation results were reported. The initial result was not confirmed; therefore, the initial result was rejected (R) as duplicate data in favor of the nondetect confirmation result.

III.8. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Compound quantitation was not evaluated at a Stage II validation. The laboratory calculated and reported compound-specific detection limits. Detects between the EDL and the RL were qualified as estimated (J) and coded with DNQ to comply with the NPDES permit. Nondetects are valid to the EDL. Per client request, results below the EDL meeting retention time and signal to noise (S/N) criteria were to be reported; however, this sample had no reported detects below the EDL.

Isomers previously qualified as method blank contamination were not further qualified as EMPCs. Remaining isomers reported as EMPCs were qualified as estimated nondetects (UJ) at the level of the EMPC. The concentrations of totals PeCDD and TCDD in sample EPSW002IE02_20200406 matched the qualified isomers and were therefore also qualified as estimated nondetects (UJ). Total HxCDD in sample LXBMP0012_20200406 (containing a qualified EMPC isomer as well as qualified method blank isomers) was also qualified as an estimated nondetect (UJ). Remaining totals flagged by the laboratory as including one or more EMPC peaks were qualified as estimated (J).

IV. METHOD 200.8— METALS

M. Hilchey of MEC^x reviewed the SDG on May 27, 2020.

The samples listed in Table 1 for this analysis were validated based on the guidelines outlined in the MEC^x *Data Validation Procedure for Metals (DVP-5, Rev. 2)*, *EPA Method 200.8* and the *National Functional Guidelines for Inorganic Method Data Review (2017)*.

IV.1. HOLDING TIMES

The analytical holding time, six months for metals, was met. The samples designated for dissolved metals analysis were filtered and preserved within 24 hours of receipt, as required on the COC.

IV.2. CALIBRATION

Initial calibration and calibration verification criteria were not evaluated for Stage II validation.

IV.3. QUALITY CONTROL SAMPLES

IV.3.1. METHOD BLANKS

There were no target analyte detections in the method blank with the exception of dissolved zinc (2.69 µg/L). The associated sample result was a detect below the RL and was qualified as nondetect (U) at the level of contamination.

**IV.3.2. INTERFERENCE CHECK SAMPLES:**

ICP-AES and ICP-MS ICSA/B data are not evaluated for Stage II validation.

IV.3.3. LABORATORY CONTROL SAMPLES

Laboratory control sample recoveries (total and dissolved) were within the QAPP control limits of 85-115%.

IV.3.4. LABORATORY DUPLICATES:

Laboratory duplicate analyses were not performed on a sample in this SDG.

IV.3.5. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analyses were performed on sample EPSW002IE02_20200406 (total and dissolved). Recoveries were within the QAPP control limits of 70-130% for all target analytes. RPDs were $\leq 20\%$ for all target analytes except total zinc (28%). The associated sample result was qualified as estimated (J).

IV.3.6. SERIAL DILUTION

Serial dilution analyses were not performed.

IV.4. INTERNAL STANDARDS PERFORMANCE

ICP-MS internal standard data are not evaluated for Stage II validation.

IV.5. COMPOUND QUANTIFICATION AND REPORTED DETECTION LIMITS

Analyte quantification is not evaluated for Stage II validation. Results reported below the RL and above the MDL were qualified as estimated (J) and coded with a DNQ to comply with the NPDES permit reporting requirements. Nondetects are valid to the MDL.

IV.6. FIELD QC SAMPLES

MEC^X evaluated field QC samples, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^X used the remaining detects to evaluate the associated site samples. Findings associated with field QC samples are summarized below:

IV.6.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

IV.6.2. FIELD DUPLICATES

There were no field duplicate samples identified for this SDG.

V. VARIOUS EPA METHODS — RADIONUCLIDES

E. Wessling of MEC^X reviewed the SDG on June 8, 2020

The samples listed in Table 1 for this analyses were validated based on the guidelines outlined in the *EPA Methods 900* and the *National Functional Guidelines for Superfund Inorganic Method Data Review (2017)*.

**V.1. HOLDING TIMES:**

According to the case narrative, one sample container was received without proper preservation. The sample was preserved at the laboratory and both samples were analyzed within holding times.

V.2. CALIBRATION:

The detector efficiency for gross alpha was less than 20%; therefore, the detected results for gross alpha (total and dissolved) were qualified as an estimated nondetects (UJ). Calibration checks were not evaluated at Level II validation.

V.3. QUALITY CONTROL SAMPLES**V.3.1. METHOD BLANKS**

Target isotopes were not detected in the method blanks above the MDC.

V.3.2. LABORATORY CONTROL SAMPLES:

The recoveries were within laboratory-established control limits.

V.3.3. LABORATORY DUPLICATES:

Laboratory duplicates were not performed on the sample from this SDG.

V.3.4. MATRIX SPIKE/MATRIX SPIKE DUPLICATE:

Matrix spike (MS)/MSD analyses were not performed on the sample from this SDG.

V.4. SAMPLE RESULT VERIFICATION:

An EPA Level II review was performed on the sample in this data package. Calculations were not verified at this validation level. Reported nondetects are valid to the MDC.

V.5. FIELD QC SAMPLES:

Field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. Any remaining detects were used to evaluate the associated site samples. The following are findings associated with field QC samples:

V.5.1. FIELD BLANKS AND EQUIPMENT BLANKS:

This SDG had no identified field blank or equipment blank samples.

V.5.2. FIELD DUPLICATES:

There were no field duplicate samples identified for this SDG.

VI. VARIOUS METHODS — GENERAL CHEMISTRY

M. Hilchey of MEC^x reviewed the SDG on May 27, 2020.

The sample listed in Table 1 for this analysis was validated based on the guidelines outlined in the *MEC^x Data Validation Procedure for General Minerals (DVP-6, Rev. 1)*, *Standard Methods for the Examination of Water*

and Wastewater 2540D and the National Functional Guidelines for Inorganic Superfund Data Review (2017).

VI.1. HOLDING TIMES

The QAPP holding time requirement, 7 days for Total Suspended Solids (TSS), was met.

VI.2. CALIBRATION

Instrument calibration review is not performed at Level II validation.

VI.3. QUALITY CONTROL SAMPLES

VI.3.1. METHOD BLANKS

The method blank had no detections.

VI.3.2. LABORATORY CONTROL SAMPLES

Laboratory control sample recovery was within the laboratory control limits.

VI.3.3. LABORATORY DUPLICATES

Laboratory duplicate analyses were not performed on a sample in this SDG.

VI.3.4. MATRIX SPIKE/MATRIX SPIKE DUPLICATE

MS/MSD analysis is not applicable to this method.

VI.4. SAMPLE RESULT VERIFICATION

Sample result verification is not performed at Level II validation. Reported nondetects are valid to the MDL.

VI.5. FIELD QC SAMPLES

MEC^x evaluated field QC samples were evaluated, and if necessary, qualified based on method blanks and other laboratory QC results affecting the usability of the field QC data. MEC^x used the remaining detects to evaluate the associated site sample. Findings associated with field QC samples are summarized below.

VI.5.1. FIELD BLANKS AND EQUIPMENT BLANKS

Field blank or equipment blank samples were not identified for this SDG.

VI.5.2. FIELD DUPLICATES

Field duplicate samples were not identified in this SDG.

Initial Calibration

Initial Calibration was not examined by AutoDV.

Continuing Calibration

Continuing Calibration was not examined by AutoDV.

9. Holding Time

All acceptance criteria were met.

10. Confirmation

None for this SDG.

11. Summary

General Comments

Field Blanks: These analytes had Blank detects: 1,2,3,4,6,7,8,9-OCDD (EB), TEQ WHO2005 ND=0 with EMPCs (EB), TEQ WHO2005 ND=0.5 with EMPCs (EB), Total Hexachlorodibenzo-p-dioxin with EMPCs (EB).

Field Duplicates: No FD Associated.

Form I Review: No samples were excluded for dilutions or re-extractions.

Method Blanks: These analytes had Method Blank detects: 1,2,3,4,6,7,8,9-OCDD, 1,2,3,4,6,7,8,9-OCDF, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, 1,2,3,4,7,8-HxCDF, 1,2,3,6,7,8-HxCDF, 1,2,3,7,8,9-HxCDF, 1,2,3,7,8-PeCDD, 1,2,3,7,8-PeCDF, 2,3,4,6,7,8-HxCDF, 2,3,4,7,8-PeCDF, 2,3,7,8-TCDD, TEQ WHO2005 ND=0 with EMPCs, TEQ WHO2005 ND=0.5 with EMPCs, Total Heptachlorodibenzofuran with EMPCs, Total Heptachlorodibenzo-p-dioxin with EMPCs, Total Hexachlorodibenzofuran with EMPCs, Total Pentachlorodibenzofuran with EMPCs, Total Pentachlorodibenzo-p-dioxin with EMPCs, Total Tetrachlorodibenzo-p-dioxin with EMPCs.

Tuning and Mass Calibration: Tuning and Mass Calibration were not examined by AutoDV.

Internal Standard Area/Retention Time: Internal Standard Area/Retention Time was not examined by AutoDV.

Initial Calibration: Initial Calibration was not examined by AutoDV.

Continuing Calibration: Continuing Calibration was not examined by AutoDV.

VDMS4.48

Data Package Completeness Package was complete for level V validation.

Forms Review/ Items of Interest

No samples were excluded for dilutions or re-extractions.

COC Review

No discrepancies.

4. Laboratory Control Sample

All acceptance criteria were met.

5. Surrogates

No surrogates in this SDG.

6. Tuning and Mass Calibration

N/A

7. Internal Standard

N/A

8. Calibration Information

Initial Calibration

There were no ICB detections found except for those specified on the Validated Form I.

Continuing Calibration

There were no CCB detections found except for those specified on the Validated Form I.

9. Holding Time

All acceptance criteria were met.

10. Confirmation

None for this SDG.

11. Summary

General Comments

Field Duplicates: No FD Associated.

Form I Review: No samples were excluded for dilutions or re-extractions.

Method Blanks: These analytes had Method Blank detects: Mercury, Dissolved.

Surrogates: No surrogates in this SDG.

Tuning and Mass Calibration: Tuning and Mass Calibration were not examined by AutoDV.

Internal Standard Area/Retention Time: Internal Standard Area/Retention Time was not examined by AutoDV.

Initial Calibration: Initial Calibration was not examined by AutoDV.

Continuing Calibration: Continuing Calibration was not examined by AutoDV.

Matrix Spike: These MS's were out of control: Mercury (MS - EVBMP0007S011MS), Mercury, Dissolved (MS - EVBMP0007S011MS). These SD's were out of control: Mercury (SD - EVBMP0007S011SD), Mercury, Dissolved (SD - EVBMP0007S011SD). These MS/SD RPD's were out of control: Mercury (EVBMP0007S011).

1. Introduction

An analysis was conducted to evaluate potential sources that may have contributed to NPDES permit benchmark (benchmark) exceedances at the Santa Susana Field Laboratory (SSFL) National Pollutant Discharge Elimination System (NPDES) Outfalls during the 2019/20 rainy season. There were no NPDES permit limit exceedances during the 2019/20 rainy season, only exceedances of benchmarks, which apply to Outfalls 001 and 002 in the southern buffer zone area. SSFL NPDES Outfall locations are shown in Figure 1.

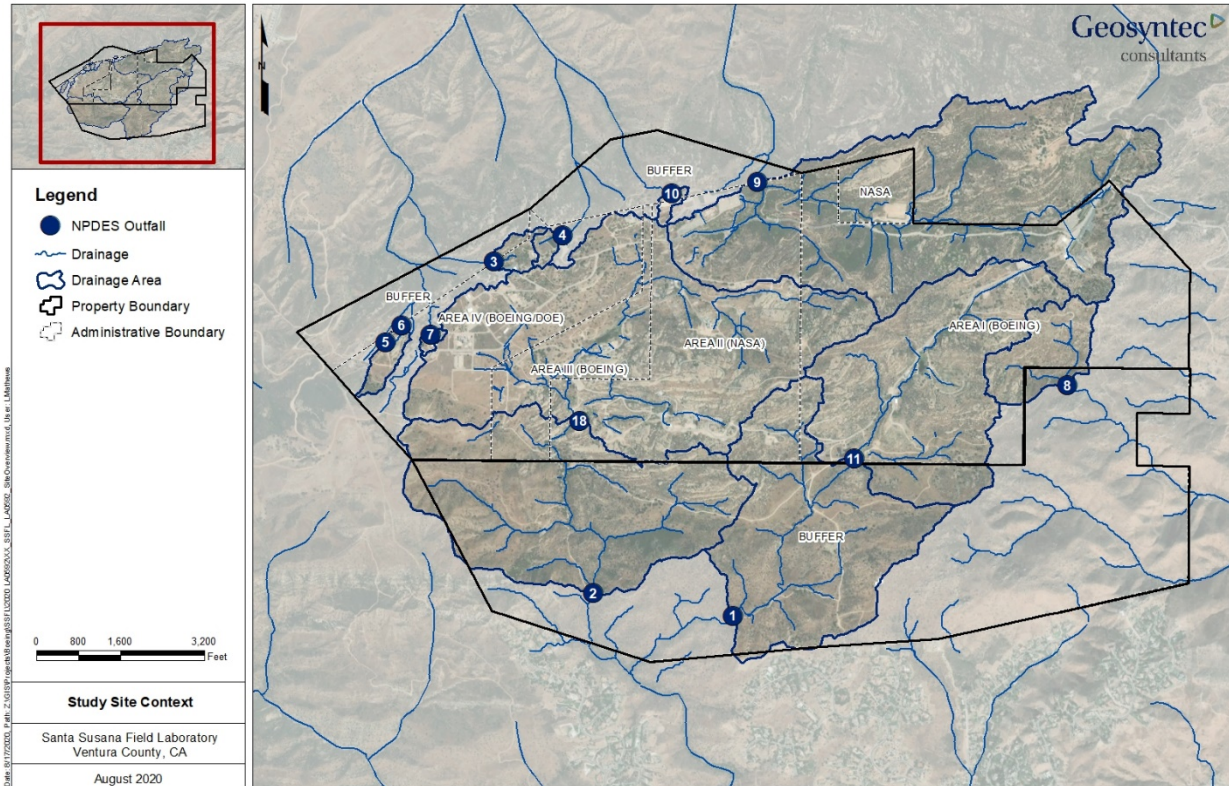

Figure 1. Santa Susana Field Laboratory (SSFL) National Pollutant Discharge Elimination System (NPDES) Outfalls

Both Outfalls with benchmark exceedances received runoff from watersheds that were almost completely burned in late 2018 in the Woolsey Fire. The intensity of the burned areas in the Outfall 001 and 002 were mostly low to moderate soil burn severity, as shown in Figure 2.

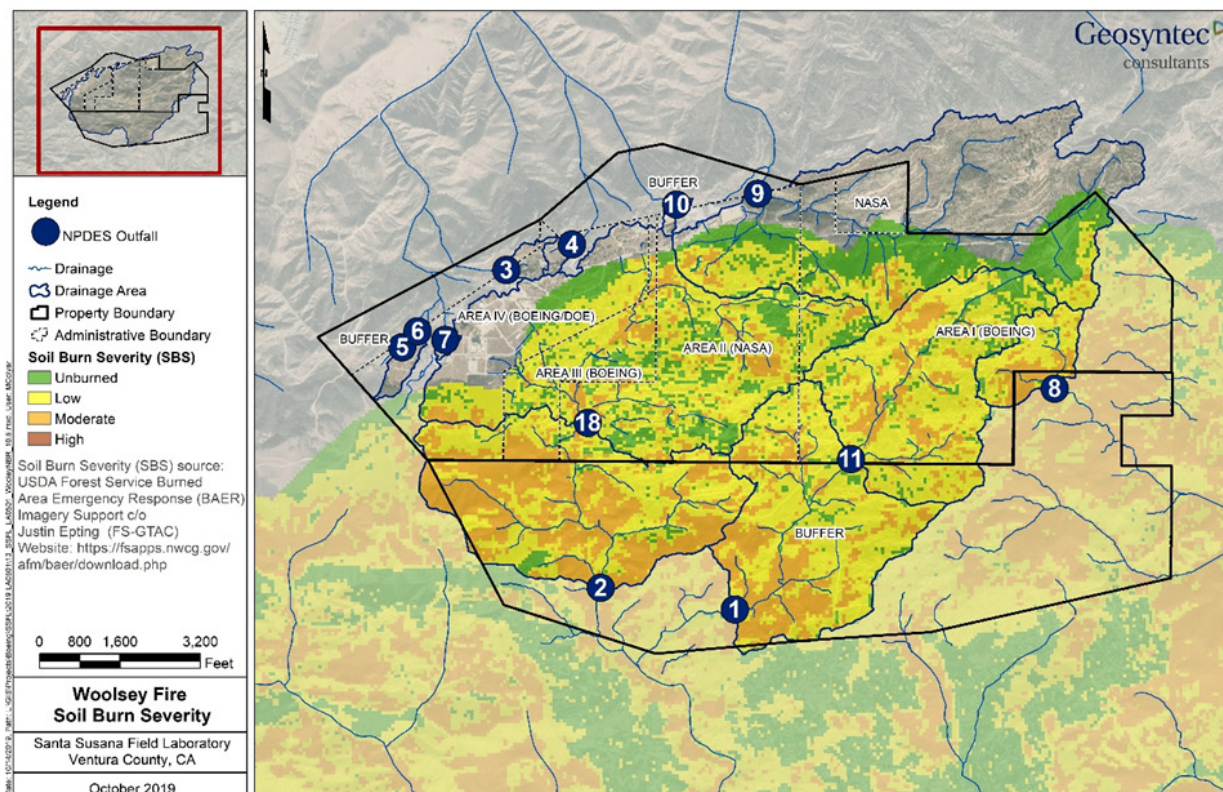

Figure 2. SSFL NPDES Outfalls Relative to Woolsey Fire Burn Area and Severity

Constituents that exceeded¹ a benchmark at least once in the 2019/20 rainy season were: iron, lead, manganese, and Tetrachlorodibenzo-p-dioxin Toxic Equivalence (TCDD TEQ) (no DNQ). The details of each exceedance are outlined in Table 1 below, along with the associated total suspended solids (TSS) concentration for each sample.

¹ Gross alpha in one Outfall 001 sample in December 2019 was indeterminate (14.1 +/-3.6 pCi/L) when compared to the daily maximum benchmark of 15 pCi/L, but the annual average for Outfall 001 (3.65 +/-0.64 pCi/L) was below the average annual benchmark so gross alpha at OF001 was in compliance for 2019, as reported in the quarterly monitoring report. Compliance for 2020 will be evaluated at the end of the calendar year. Therefore, gross alpha is not evaluated further in this report.

APPENDIX C: 2019/20 Exceeding Constituent Source Investigation

Table 1. 2019/2020 Benchmark Exceedances

Date	Outfall	Parameter	Units	Result	Limit	TSS (mg/L)
12/27/2019	001	Gross Alpha ¹	pCi/L	14.1 +/-3.6	15	190
12/27/2019	001	Iron	mg/L	14	0.3	190

3/14/2020	002	Iron	mg/L	1.3	0.3	14

¹ Gross alpha was in compliance for 2019, as reported in the quarterly monitoring report. Therefore, gross alpha is not evaluated further in this report.

A variety of natural and anthropogenic sources present at the SSFL were evaluated to determine their potential to contribute to surface water benchmark exceedances at these outfalls. This evaluation was accomplished by performing various data analyses to establish a “weight of evidence” means of hypothesis testing. Various lines of evidence (LOEs), as described in sections below, were evaluated to determine the likelihood that a source was a major contributor to constituents exceeding the benchmarks at the outfalls. The potential sources evaluated, and the associated sampling performed for each, include:

- Impacted Surface Soils:** Soils from areas impacted by former operations were characterized for the Resource Conservation and Recovery Act (RCRA) program and other regulatory programs, such as the Interim Source Removal Action (ISRA) to support NPDES compliance, in the Outfall 008 and Outfall 009 watersheds between 1986 and 2013. The ISRA program was implemented in response to a Los Angeles Regional Water Quality Control Board (LARWQCB) Cleanup and Abatement Order (CAO), to improve surface water quality within the Outfall 008 and 009 watersheds by identifying and removing areas of contaminated soil potentially contributing to NPDES permit limit and benchmark exceedances. During ISRA implementation activities between 2009 and 2013, soils were tested and areas with elevated concentrations of arsenic, cadmium, copper, lead, zinc, TCDD TEQ (no DNQ), or mercury above ISRA soil remediation goals were identified. These areas were excavated, and removed soils were disposed offsite. Confirmation sampling was performed within excavations and additional soils were removed as necessary, prior to backfilling and restoration. Surface soils evaluated under ISRA but left in-place, were also included as a reference for potentially impacted soils that remain onsite. While these ISRA samples were only collected in Outfall 008 and 009 watersheds, these results are used as a comparison for watersheds across the site.
- Pavement solids:** Particulates on pavements were collected quarterly from six sites throughout the Outfall 009 watershed between 2016-2017. The collected samples were sieved into three size fractions for analyses. Only the <75 micrometer (µm) fraction is considered here, since this is the

most likely particle size to be mobilized by stormwater and was found to have the highest concentrations of constituents.

- Treated Wood:** Treated wood and adjacent soils were evaluated by collecting a shaved wood sample from a treated wood utility pole and sampling the soil adjacent to treated woods at several locations in 2016. While treated wood is the source of elevated constituents, the adjacent soils are what are likely to be mobilized rather than the treated wood itself.
- Atmospheric Deposition:** Dry atmospheric deposition samples were collected monthly at the SSFL Fire Station and Helipad over the course of a year between 2016-2017. Atmospheric deposition was (and continued to be) evaluated to determine whether typical dry deposition occurring at the site that is mobilized during wet weather may have contributed to exceedances.
- Background Soils:** Natural background soils were evaluated based on data collected during a number of previous soil studies. The first study considered was the Soil Background Report (MWH 2005), which characterized soils in undeveloped and unimpacted areas of SSFL to define ambient background concentrations of various constituents at SSFL. This report also included results from the Multi-Media Sampling Report for the Brandeis-Bardin Institute (BBI) and the Santa Monica Mountains Conservancy (SMMC) (McLaren/Hart 1993b), RCRA Facility Investigations (RFI) Work Plan Addendum (Ogden 1996), Former Sodium Disposal Facility (FSDF) Characterization Report (ICF 1997), Bell Canyon Area Soil Sampling Report (Ogden 1998b), and Standardized Risk Assessment Methodology (SRAM) Work Plan (Ogden 2000a). Offsite background soils were evaluated in the California Department of Toxic Substances Control (DTSC) SSFL Background Soils Study (DTSC 2012), which organizes its results by sample depth and between the Chatsworth and Santa Susana formations. Only surface soils were used to evaluate the solids concentration in the Chatsworth and Santa Susana formations. Figure 3 shows the formations underlying each watershed, the majority of which are exclusively Chatsworth formation.

Figure 3. Geologic Formations Underlying SSFL Watersheds

Each LOE is described in detail below to help test the following questions:

- Have concentrations of COCs at the outfalls returned to normal compared to the 2018/19 post-wildfire year (i.e., there is no lingering water quality effect from the wildfire, and thus sources responsible for this year’s exceedances would be non-fire-related)?
- Are there local sources unique to particular watersheds where exceedances are occurring (i.e., pollutant-leaching materials or impacted soils explain concentration differences between outfalls, rather than sources that occur uniformly across the site and affect all outfalls, like natural soils and atmospheric deposition)?
- Can forensic and fingerprinting analyses independently determine if 2019/20 benchmark exceedances were caused by one or more of the potential sources investigated?

2. Lines of Evidence

One way to evaluate potential sources is to consider multiple lines of evidence (LOEs). This approach uses independent assessments and findings to see if they concur in the identification of potential source(s). Multiple LOEs were considered when investigating potential sources of exceedances. Each LOE and how it was used to support a particular source conclusion is summarized in Table 2 and described below. Where more than one LOE supports that a source may be a contributor for a particular constituent, then there is a greater likelihood that the hypothesized source contributed to or caused the exceedance.

Table 2. Questions and Lines of Evidence

Questions	Line of Evidence	Criteria to Answer 'Yes' to Questions
Have concentrations have returned to normal compared to the 2018/19 post-wildfire year?	Temporal Patterns	Concentrations in 2019/20 are similar to non-wildfire years
Are there local sources unique to particular watersheds where exceedances are occurring?	Spatial Patterns	Particulate strengths differ between watersheds (i.e. box plots do not overlap)
Can 2019/20 benchmark exceedances be the result of one or more of the potential sources investigated?	Particulate Strengths	The upper range (i.e. the upper bar in the box plots) of the solids concentration (i.e. soils, pavement solids, etc.) is greater than or equal to the stormwater particulate strength
	Fingerprinting: Metal Ratios	Stormwater results are within the 95 th percentile confidence interval for background soils
	Fingerprinting: Dioxin Congeners	Cluster and principle component analyses show similar patterns between stormwater samples and source samples
	Chemical Mass Balance	Chemical mass balance modeling calculates the relative contributions of likely sources affecting the outfalls

2.1. Temporal Patterns

Temporal patterns were used to evaluate whether concentrations have returned to normal compared to the 2018/19 post-wildfire year. Constituent-specific concentration timeseries plots are included and discussed in their respective results sections in Section 3. Each timeseries only considers the same outfalls that discharged in 2019/20 (Outfalls 001, 002, 008, 009, and 018) in order to provide a consistent comparison of watershed conditions. Appendix F contains full scale timeseries plots for the last four years for each of the constituents that exceeded benchmarks in 2019/20.

Rainfall patterns in the 2019/20 year were compared against rainfall patterns from 2016/17, 2017/18, and 2018/19 (the reporting year when the Woolsey Fire occurred) to investigate relationships between rainfall amounts and stormwater concentrations as shown in Figure 4. This comparison revealed that 2019/20 had a different rainfall pattern than 2016/17 and 2018/19, despite having similar amounts of total rainfall. 2016/17 and 2018/19 were similar rain years, but the impacts of the Woolsey Fire resulted in increases in both discharges and exceedances compared to the otherwise similar non-wildfire year. Despite the differences in rainfall patterns, 2016/17 and 2019/20 were similar in total rainfall as well as the total

number of discharges and exceedances. 2017/18 was a below average rainfall year, so it is expected that the stormwater concentrations and exceedances would follow a different pattern.

Figure 4. Cumulative Annual Rainfall for 2019/20 Compared to Previous Years

Volumetric runoff coefficients (Rv) were obtained by dividing the runoff amounts (inches of runoff) by the rainfall amount (inches) and compared between three time periods: pre-Woolsey Fire (2009-2018), the reporting year when the Woolsey Fire occurred (2018/19), and the 2019/20 year. The Rv values were grouped by time period, outfall, and rain event size and the groupings were evaluated for significant differences using the Mann-Whitney Rank Sum Test. P-values from the Mann-Whitney Rank Sum Test determined that median Rv values in the 2019/20 reporting year were significantly different from the 2018/19 reporting year during small storms (<2 inches of rainfall) at Outfalls 001, 002, and 008 (p < 0.05). Additionally, as shown in Table 3, none of the 2019/20 categories were significantly different from the pre-Woolsey Fire results (p > 0.05). While storm water runoff increased for small storms after the Woolsey Fire, the runoff in the 2019/20 season was most similar to the pre-Woolsey Fire period, and the runoff volume analysis indicates no significant runoff impacts from the Woolsey Fire remain.

Table 3. Runoff Volume Effects Following the Woolsey Fire Have Returned to Previous Levels

		Storm Size	
		<2 inches	>2 inches
2018/19 vs pre-fire years	Burned Watersheds	Significant increase (7x)	No significant difference
	Unburned Watersheds	No significant difference	No significant difference
2019/20 vs pre-fire years	Burned Watersheds	No significant difference	No significant difference
	Unburned Watersheds	No significant difference	No significant difference

The number of exceedances that occurred at each Outfall was tallied for each event and plotted with date, as shown in Figure 5. The plot below shows there was a marked decrease of exceedances over the course

of the 2019/20 rainy season, as there was during the 2016/17 and 2018/19 rainy seasons. In the 2018/19 post-wildfire season, however, the number of exceedances was notably higher at the beginning of the season followed by a steep decline. This presumably reflects regrowth of vegetation, which reduces soil mobilization following the fire. However, in 2016/17 and 2019/20, the more gradual downward trend may reflect a seasonal first flush pattern. The number of exceedances at the beginning of the 2019/20 rainy season was notably less than at the beginning of the 2018/19 rainy season but higher than the 2016/17 and 2017/18 rainy seasons, suggesting there may be some lingering water quality impacts from the Woolsey Fire.

Figure 5. Temporal Trend of Outfall Exceedances in 2019/20 Compared to Previous Years (2016/17-2019/20)

The number of discharges and exceedances at Outfall 001 and 002 during the 2016/17, 2017/18, 2018/19 (immediately following the Woolsey Fire), and 2019/20 rainy seasons are shown in Table 4. While the overall number of exceedances in 2016/17 and 2019/20 was similar, the exceedances in 2019/20 were limited to Outfall 001 and 002. Outfall 001 and 002 had a similar number of discharges in 2016/17 and 2019/20, but twice as many exceedances in each watershed in 2019/20. This suggests that the limited lingering water quality impacts from the Woolsey Fire may be limited to these two watersheds. Constituent-specific concentration trends are discussed in their respective results sections in Section 3.

Table 4. Annual Rainfall Compared to Discharges and Exceedances at Outfall 001 and Outfall 002 (2016/17-2019/20)

Reporting Year	Annual Rainfall (in.)	Outfall 001		Outfall 002	
		Exceedances /Discharges	Exceeding Parameters ¹	Exceedances /Discharges	Exceeding Parameters ¹
2016/17	23.35	4/3	Iron Lead Manganese TCDD TEQ (no DNQ)	2/6	Chronic toxicity Iron
2017/18	9.77	0/0	N/A	1/1	Iron
2018/19 (Post-Woolsey Fire)	26.29	6/7	Iron Lead Manganese	27/10	Arsenic Copper Gross alpha Iron Lead Manganese Selenium Sulfate TCDD TEQ (no DNQ) Zinc
2019/20	20.54	8/3	Iron Lead TCDD TEQ (no DNQ)	4/8	Iron Manganese TCDD TEQ (no DNQ)

1. Parameters that exceeded at a given Outfall in 2019/20 are shown in **bold**.

2.2. Spatial Patterns

Spatial patterns were used to evaluate whether there are sources unique to particular watersheds that were responsible for benchmark exceedances. Box plots were used to illustrate the basic statistics of each watershed’s water quality and provide a visual comparison of results. As shown in Figure 6, the box plots reflect the median, 25th percentile, 75th percentile, 1.5 quartile values, in addition to outliers outside of the 1.5 quartiles, if applicable. The individual result concentrations are shown over the box plots to differentiate between detected (black border) and non-detected (gray border) results. A difference in concentration or particulate strengths may indicate there was a unique source within a particular watershed (particulate strengths are described in more detail in Section 2.3). Watershed conditions and Best Management Practices (BMPs) were considered in this analysis and results from each watershed are colored accordingly in the plots for each constituent with a benchmark exceedance in the 2019/20 rainy season.

Figure 6. Box Plot Key

2.3. Particulate Strengths

Particulate strength (PS) calculations were used to determine if solids concentrations in potential sources are high enough to cause benchmark exceedances in stormwater. PS is the constituent concentration associated with particulate matter in stormwater and is a means to normalize stormwater constituent concentrations by TSS. Normalizing constituent concentrations by TSS is helpful for comparing solid concentrations of hypothesized sources with the particulate material in the aqueous stormwater samples. This tool is useful for the constituents that are highly associated with particulates and are not found in significant quantities in filtered (dissolved) forms. PS values have been previously used by the Surface Water Expert Panel and Geosyntec to assess sources of metals in SSFL NPDES outfall compliance monitoring data (SSFL Surface Water Expert Panel, 2009). PS is calculated by the following equation and applying the appropriate unit conversions.

$$PS = \frac{(\text{total concentration} - \text{filtered concentration})}{\text{total suspended solids concentration}}$$

Samples where both the total and filtered concentrations were detected were used to determine the average filtered fractions for each constituent at each sample location. This average filtered fraction was used in the PS calculations for samples with no filtered fraction reported or for filtered results below the detection limit. If the total concentration was below the detection limit, the detection limit was used for the non-detected values. TCDD TEQ is assumed to have a filtered fraction of zero because of the congeners' extremely low solubility and high partitioning coefficient to solids.

The solid source sample results represent bulk samples and include all particle sizes, with the exception of pavement solids, where the fine fraction (<75 μm) was considered separately. This is important to note, because the PS of the fine fraction is typically higher than the bulk fraction. Also, outfall stormwater samples typically contain a higher percent of the fine fraction compared to the original sources due to the selective mobilization of fine particles in stormwater runoff. For example, the fine fraction of sediments collected from the Outfall 009 watershed had a median lead solids concentration over four times higher than the rest of the sample (46.9 mg/kg in fine vs 10.2 and 10.7 mg/kg in medium and coarse, respectively). More importantly, as shown in Figure 7, the fine fraction concentration was over four times higher than the median bulk concentration of the soil sample calculated using the weighted average of each size fraction. This means the outfall sample PS is more influenced by the smaller particle sizes, which have a higher constituent PS. This needs to be considered when comparing the PS of outfall samples to the source samples that are based on bulk solids.

Figure 7. Lead Concentration in Northern Drainage Sediment by Size Fraction

If the upper range of the solids concentration (i.e. the upper bar in the box plots indicating the 75th percentile + 1.5 interquartile range [IQR]) was greater than or equal to the stormwater PS, a supporting LOE was found (i.e., supporting the hypothesis that the source material was likely contributing to the exceeding concentration). An example plot with annotations is shown in Figure 8.

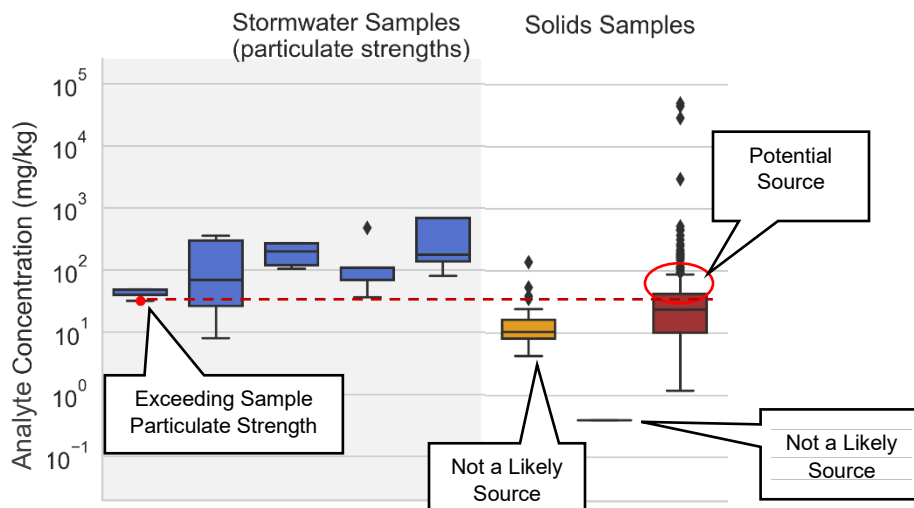

Figure 8. Example PS Plot

2.4. Fingerprinting: Metal Ratios

Metal ratio fingerprinting were used as a second LOE, in addition to PS, to determine if background soils could have caused 2019/20 benchmark exceedances. Metal ratios were used to identify potential constituent sources by the ratio of concentrations of multiple constituents in source material samples and benchmark exceedance samples. Iron and manganese were chosen to be the reference analytes because they are primarily soil derived and present at a relatively consistent concentration, and their PS results confirm this general understanding by matching levels in background soils. The ratios to iron and

manganese are presented in plots showing the median ratio and 95th percentile confidence interval for background soils compared to individual stormwater results. Figure 9 shows an example plot, which includes the individual background soil data points used to determine the median and confidence interval. Where stormwater results were within ranges found for background soils, as is the case for the exceeding samples outlined in red below, a supporting LOE was found (i.e., supporting the hypothesis that the source of exceedances was background soils). NPDES sampling frequency requirements differ between parameters and as a result, not all samples have concurrent iron and manganese samples².

Note: PS values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red border.

Figure 9. Example Analyte: 2019/20 Iron Metal Ratio Plot

2.5. Fingerprinting: Dioxin Congeners

Dioxin congener fingerprinting was used to determine if the 2019/20 benchmark exceedances for dioxin concentrations were caused by one or more of the material sources investigated. Under the NPDES Permit, dioxin concentrations in stormwater are evaluated against the effluent limits and benchmarks using TCDD TEQ no DNQ, which is a scaled sum of seventeen individual congeners excluding results detected below the quantifiable reporting limit. TCDD TEQ is calculated by multiplying the individual congener concentration by their corresponding 1998 World Health Organization toxic equivalency factor (WHO TEF) (Berg et al., 2006) and Great Lakes bioaccumulation equivalency factor (BEF) (Environmental Protection Agency, 1995) values listed in Table 5 below. For fingerprinting purposes, TCDD TEQ values were calculated to include DNQ results, as opposed to the NPDES reporting protocol, which excludes DNQ.

² For iron and manganese, the NPDES Permit for SSFL (NPDES NO. CA0001309) states that, “If the detected concentration exceeds the criteria, the frequency of analysis must be increased [from once per year] to once per discharge (once per month at Outfall 019/020). After four consecutive samplings demonstrate compliance, then the frequency reverts back to annual sampling.”

Table 5. TCDD TEQ: WHO TEF and BEF Values

Congener	1998 WHO TEF	BEF Great Lakes Water Quality Initiative
2,3,7,8-TCDD	1	1
1,2,3,7,8-PeCDD	1	0.9
1,2,3,4,7,8-HxCDD	0.1	0.3
1,2,3,6,7,8-HxCDD	0.1	0.1
1,2,3,7,8,9-HxCDD	0.1	0.1
1,2,3,4,6,7,8-HpCDD	0.01	0.05
OCDD	0.0001	0.01
2,3,7,8-TCDF	0.1	0.8
2,3,4,7,8-PeCDF	0.5	1.6
1,2,3,7,8-PeCDF	0.05	0.2
1,2,3,4,7,8-HxCDF	0.1	0.08
1,2,3,6,7,8-HxCDF	0.1	0.2
1,2,3,7,8,9-HxCDF	0.1	0.6
2,3,4,6,7,8-HxCDF	0.1	0.7
1,2,3,4,6,7,8-HpCDF	0.01	0.01
1,2,3,4,7,8,9-HpCDF	0.01	0.4
OCDF	0.0001	0.02

Evaluating the TCDD TEQ value of each of the seventeen congeners and their percent contribution to total TCDD TEQ in stormwater showed which congeners were contributing most to the overall TEQ and were therefore driving the exceedances. Additionally, cluster and principle component analyses were used to identify similar patterns between source congeners and outfall congeners in order to determine the likely major sources of TCDD TEQ congeners in outfall samples. Principal component analyses were performed using Minitab (version 16). The calculated eigenvalues indicate how the different variables (the congeners here) contribute to explaining the variability in the data set. The first principal component accounts for most of the variability, while the others contribute less amounts. The loading for each variable indicates the relative significance for each variable per principal component. The scree plot shows the relative contributions for each component. Usually, the first two or three principal components contribute most of the total explanation of the variability, as indicated by the additional components contributing very little. The score plot is a scatter plot of the loadings for the first two principle components and indicates how the outfall and sources are related.

These congener multivariate analyses identify the major source component. Mixtures of sources affect the relative abundance of congeners and therefore are not identified in this analysis. Dendrograms and score plots were used to illustrate the relationships between outfall and source samples for the congeners. Chemical mass balance calculations were also used to complement these multivariate analyses and allowed the likely components of the congeners, as well as selected metals, to be identified, as described below.

2.6. Chemical Mass Balancing Calculations

Chemical mass balance (CMB) calculations were used to quantify the likely sources of TCDD congener and selected heavy metals under a variety of scenarios for the SSFL outfalls. The CMB model is a chemical mass balance set of equations with Monte Carlo statistical simulations to determine the most likely source components of outfall discharges. A “Library” file describes the characteristics of each potential source, and includes the mean, coefficient of variation, and the type of distribution (Normal or Log-Normal). The set of simultaneous equations are then defined by the model relating the data from this “Library” file with the data at the outfall. These simultaneous equations are solved using the Gaussian-Elimination method. For the calculations described in this paper, 500 or 1,000 runs were used to estimate the mass contributions of each source for each outfall scenario. Each run generates a value of the contribution of each source based on the statistical parameters for the constituents, resulting in an equal number of values of mass contributions as there are runs, which are then summarized.

The most abundant TCDD congeners (those having the fewest non-detected values) for potential sources and the corresponding data for the 2019/2020 outfall observations are shown in Table 6, while Table 7 shows the source and outfall data for the metals and TCDD. In both cases, four potential sources and four analytes were used in the calculations, as all sources and outfalls must have complete data sets available, with no missing analytes, which means certain sources evaluated through other methods could not be included here (for example, atmospheric deposition or soils near treated woods).

Table 6. TCDD Congener Particulate Strength Values for Potential Sources and Outfalls

Median values, ng/kg	OCDD	1,2,3,4,6,7,8-HpCDF	OCDF	1,2,3,4,6,7,8-HpCDD
SSFL Background Soils	45.35	2.45	5.90	7.50
Pavement Solids Fines	2,250	66.2	158	296
SSFL ISRA Soil in place	114	4.85	9.48	13.00
SSFL ISRA Soil excavated	1,525	14.4	31.7	122
Outfall 001 (2019/2020)	4,105	17	28	526
Outfall 002 (2019/2020)	1,820	579	735	222
Outfall 008 (2019/2020)	0.57	192	0.57	124
Outfall 009 (2019/2020)	1,540	620	500	188
Outfall 018 (2019/2020)	678	615	1,127	512

Table 7. Metal and TCDD TEQ (No DNQ) Particulate Strength Values for Potential Sources and Outfalls

Median values, mg/kg	Copper	Lead	TCDD TEQ (No DNQ)	Zinc
Pavement Solids Fines	83.05	39.9	7.07E-06	196.5
SSFL Background Soils	9.75	14.0	1.11E-10	52.5
SSFL ISRA soil excavated	13.6	24.0	1.14E-07	71.85
SSFL ISRA soil in place	10.5	12.6	1.13E-08	60.9
Outfall 001 (2019/2020)	53.5	48.8	2.67E-07	241.1
Outfall 002 (2019/2020)	57.1	N/A	1.67E-09	N/A
Outfall 008 (2019/2020)	97.6	N/A	3.85E-10	N/A
Outfall 009 (2019/2020)	45.5	72.72	2.00E-09	N/A
Outfall 018 (2019/2020)	190.9	N/A	1.45E-09	N/A

N/A indicates the median value was no particulate present, i.e. the total and dissolved concentrations were equal or both were not detected.

The congener data calculations had poor to fair reliability, while the metals and TCDD calculations had fair to good reliability, based on the amount and consistency of information available. Therefore, there is a moderate to large amount of uncertainty associated with the calculated relative contributions.

3. Results

This section presents the Outfall stormwater results for each constituent that exceeded benchmarks in 2019/20 according to the LOEs approaches described above.

3.1. Total Suspended Solids

TSS does not have a benchmark or permit limit defined, however, it is useful to interpret general trends. Stormwater concentrations of TSS in the 2019/20 season have decreased overall compared to the 2018/19 season, as shown in Figure 10. The concentrations are most similar to the 2016/17 season, which received a similar total rainfall depth. The long-term site-wide concentrations indicate that 2019/20 concentrations are generally in line with the range of concentrations in pre-fire years. **The temporal patterns of TSS concentrations indicate that concentrations in 2019/20 are similar to other non-wildfire years with similar rainfall (2016/17).**

Notes:

1. Markers with a black border signify detected results.
2. Markers without a border signify non-detected result and are shown at the method detection limit.
3. Regression line for long-term trend is statistically significant.

- Logarithmic Regression Model

- Outfall 001
- Outfall 002
- + Outfall 018
- ◆ Outfall 008
- ▲ Outfall 009

Figure 10. Timeseries of TSS Concentrations 2012/13-2019/20

As shown in Figure 11, concentrations of TSS were highest at Outfall 001, which receives runoff from an undeveloped watershed³. The Outfall 002 watershed, which is also undeveloped, had several samples with TSS concentrations in the same range as Outfall 001. The highest TSS concentrations at Outfall 002 occurred when the discharge consisted purely of Outfall 002 watershed stormwater runoff (i.e. Outfall 018, which flows into the Outfall 002 watershed, was not discharging). **This spatial pattern suggests that areas with higher TSS concentrations may be associated with erosion of natural background soils in undeveloped watersheds without the stormwater treatment measures or significant BMPs that are prevalent in the more developed watersheds.** However, this alone does not indicate BMPs are necessary as these outfall concentrations are generally in line with or lower than natural watershed concentrations, and even the higher TSS concentrations measured this year are within the typical range of TSS concentrations for stormwater.

Figure 11. 2019/20 TSS Concentrations by Outfall

3.2. Iron

Iron concentrations were above the benchmark at Outfalls 001 and 002 a total of six times in the 2019/20 season (there is no limit for iron at Outfall 009). Stormwater concentrations of iron have decreased overall compared to the 2018/19 season, as shown in Figure 12. Notably, this year's iron concentrations at Outfall 002 and 008 were markedly lower than in 2018/19, while concentrations at Outfall 001 were relatively similar. On average, concentrations measured in 2019/20 were similar to the range of concentrations in 2016/17 and benchmark exceedances have occurred at Outfall 001 and/or Outfall 002 during most non-wildfire years. **The temporal patterns of iron concentrations indicate that concentrations in 2019/20 were similar to the range of concentrations observed in non-wildfire years.**

³ Although the median TSS concentration was highest at Outfall 001, the dataset is not sufficiently large to determine if this difference is statistically significant.

Figure 12. Timeseries of Iron Concentrations 2012/13-2019/20

As shown in Figure 13a, iron concentrations were highest at Outfall 001 and generally followed the same pattern as TSS for each outfall⁴. As shown in Figure 13b, the PS values were more consistent across outfalls, indicating the differences in concentrations were driven by TSS rather than a concentrated source. **The spatial pattern indicates that all outfalls likely shared the same diffuse, site-wide source of iron in stormwater.**

⁴ Although the median iron concentration was highest at Outfall 001, the dataset is not sufficiently large to determine if this difference is statistically significant.

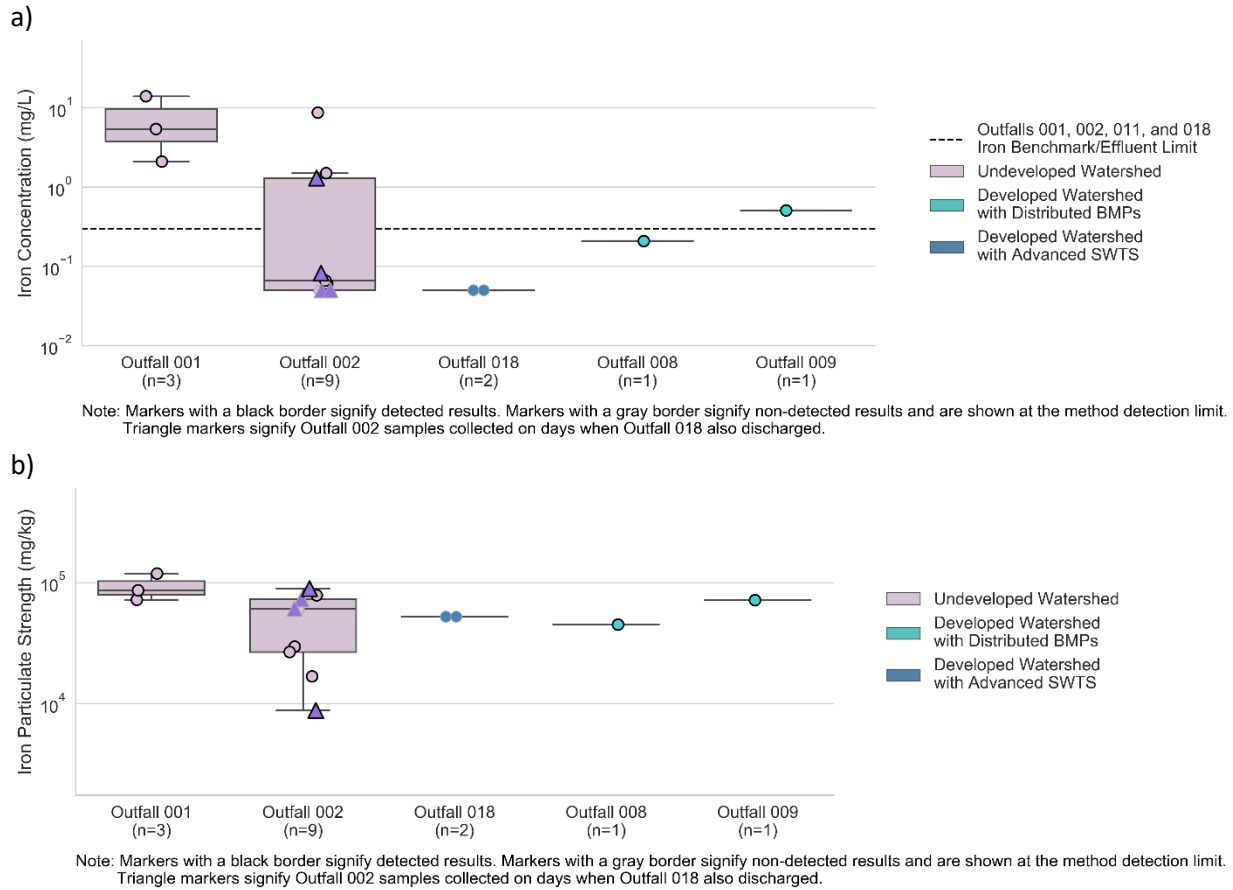

Figure 13. 2019/20 Iron Concentrations and Particulate Strengths by Outfall

The PS of iron in stormwater, plotted in Figure 14, was compared to the concentration of iron in various solid source samples. With the exception of one sample at Outfall 002, which was in-line with the concentrations in background soils, the PS values of the exceeding samples were higher than the concentrations in the sources evaluated. Future analysis distinguishing the differences between particle sizes in background soils is recommended to determine if background soils, particularly in the fine fraction, are a contributing source. Research indicates that total iron concentrations increase in soils with higher clay and silt content (i.e., soils in the fine fraction; Sharma et al., 2008) suggesting that the concentrations in background soils in the fine fraction may be higher than in bulk samples. **The PS values of the exceeding samples could not be explained by the source samples evaluated, but background soils could not be ruled out as a potential source due to potentially elevated concentrations in soil fines.**

Note: Particulate strength values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red dot.

Figure 14. Iron Particulate Strength (2019/20 Outfall Stormwater Samples) vs. Solid Source Materials

The PS of iron was compared against manganese (both are found in relatively consistent concentrations in soils) to evaluate if any of the stormwater and soil patterns were similar. Figure 15 shows that the ratios found in the exceeding stormwater samples fall within the background soil 95% confidence interval, which supports **that background soils were a likely source of the iron exceedances** in the 2019/20 season.

Note: PS values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red border. Markers with a black border signify detected results that did not exceed a benchmark. Markers with a gray border signify an estimated PS where the dissolved fraction or TSS was not detected. Markers without a border signify an estimated PS where the constituent under evaluation was not detected in the sample.

Figure 15. 2019/20 Iron:Manganese Metal Ratio Plot

3.3. Lead

Lead concentrations were above the benchmark at Outfall 001 once in 2019/20. Although benchmark/permit limit exceedances occurred in most years, the exceeding concentrations in the 2018/19 post-wildfire year were higher than in non-wildfire years, as shown in Figure 16. Stormwater concentrations of lead decreased over the course of the 2019/20 season and were notably lower than during 2018/19, suggesting that lead concentrations this year were not caused by post-wildfire conditions. Further supporting this, 2016/17, the most similar rain year, had similar concentrations to 2019/20. **The long-term temporal patterns of lead concentrations indicate that concentrations in 2019/20 were similar to other non-wildfire years.**

Notes:

1. Markers with a black border signify detected results.
2. Markers without a border signify non-detected result and are shown at the method detection limit.
3. Regression line is not statistically significant and is not shown.

- Lead Benchmark/Permit Limit
- Start of Woolsey Fire (11/8/2018)
- Outfall 001
- Outfall 002
- + Outfall 018
- ◆ Outfall 008
- ▲ Outfall 009

Figure 16. Timeseries of Lead Concentrations 2012/13-2019/20

As illustrated in Figure 17a, lead concentrations were highest at Outfall 001⁵. Figure 17b shows that the PS values of the detected results at Outfall 001 were similar to the detected results at Outfalls 002, 008, and 018. This indicates that the differences in concentrations between these outfalls were driven by TSS rather than a concentrated source. The detected results at Outfall 009 were notably higher, suggesting there may be a local source of lead in that watershed, such as pavement solids or the former shooting range. However, concentrations at Outfall 009 were not sufficiently high to cause exceedances in 2019/20. **The spatial pattern indicates that Outfall 001 shared the same diffuse, site-wide source of lead with other outfalls.**

⁵ Although the median lead concentration was highest at Outfall 001, the dataset is not sufficiently large to determine if this difference is statistically significant.

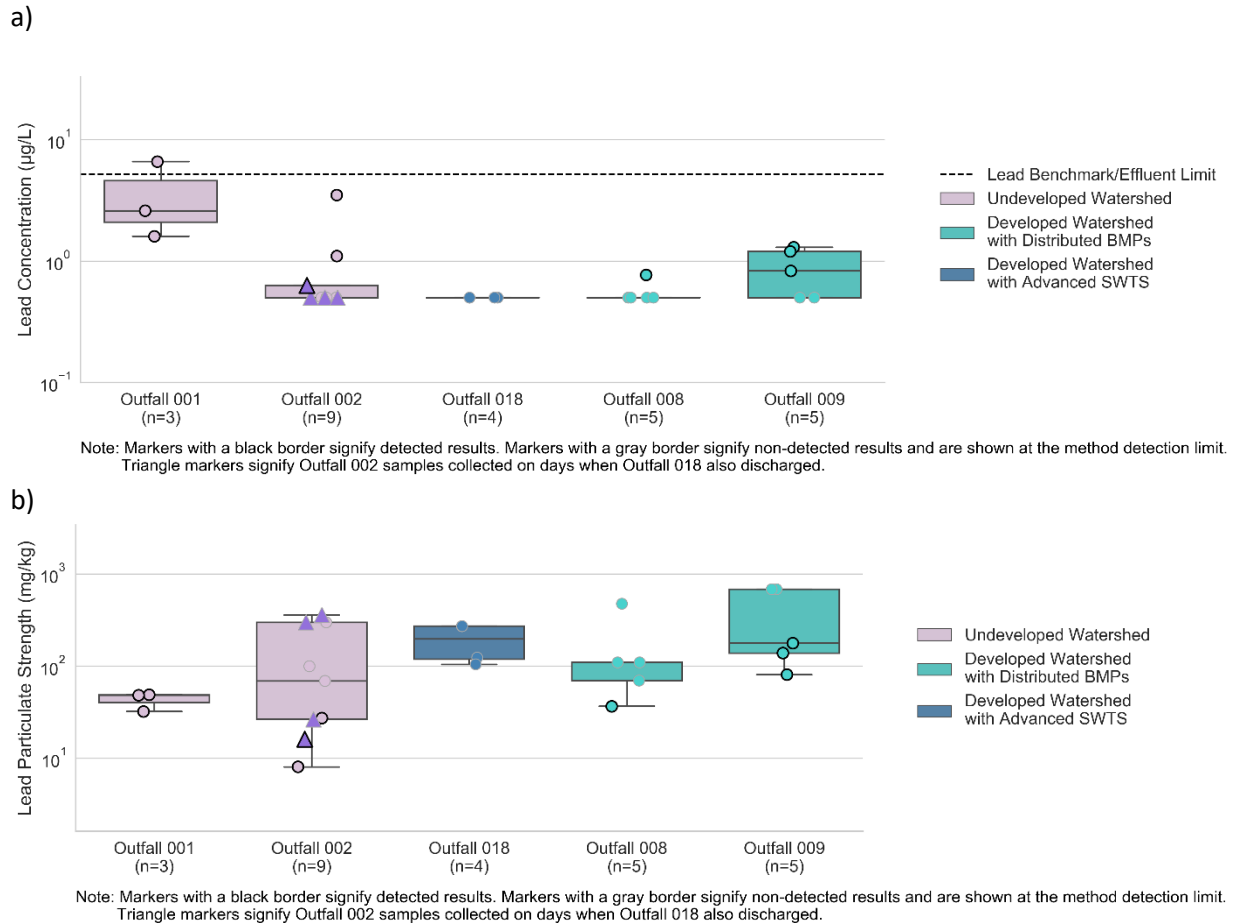

Figure 17. Lead Concentrations at Outfalls in 2019/20 Compared to Previous Years

The PS of the outfall stormwater samples compared to the various potential sources are shown in Figure 18. The exceeding sample's PS was below the upper range for atmospheric deposition, fine pavement solids, impacted soils, and background soils. However, impacted soils are unlikely to be a source of the exceedance at Outfall 001 due to the relatively small quantity of impacted soils in the Outfall 001 watershed. Additionally, preliminary results of the buffer zone subarea (included in Appendix E) study found no elevated lead in stormwater from potentially impacted soil subareas in the buffer zone. This indicates the **lead exceedance in stormwater at Outfall 001 could have come from atmospheric deposition, pavement solids fines, and/or background soils.**

Note: Particulate strength values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red dot.

Figure 18. Lead PS (2019/20 Outfall Stormwater Samples) vs. Solid Source Materials

The PS of lead was compared against iron and manganese (which are soil-based) to evaluate if any of the outfall stormwater and soil samples exhibited a similar pattern. Figure 19 shows that the ratio found in the exceeding stormwater sample falls on the background soil median slope line for iron. The exceeding sample did not have a concurrent measurement of manganese to evaluate the ratio to manganese; however, most of the other stormwater samples fall within the 95% confidence interval for manganese. These results further **support background soils as a likely source of the lead exceedance** during the 2019/20 rainy season.

Note: No samples were analyzed for manganese concurrently with the exceeding lead sample. Markers with a black border signify detected results that did not exceed a benchmark. Markers with a gray border signify an estimated PS where the dissolved fraction or TSS was not detected. Markers without a border signify an estimated PS where the constituent under evaluation was not detected in the sample and PS was calculated using the detection limit resulting in a high estimate.

Figure 19. 2019/20 Lead Metal Ratio Plots

3.4. Manganese

Manganese concentrations were above the benchmark at Outfall 001 once in 2019/20. As shown in Figure 20, stormwater concentrations of manganese were notably lower than during 2018/19, suggesting that manganese concentrations this year were not caused by post-wildfire conditions. **The temporal patterns of iron concentrations indicate that concentrations in 2019/20 were similar to other non-wildfire years.**

Notes:

1. Markers with a black border signify detected results.
2. Markers without a border signify non-detected result and are shown at the method detection limit.
3. Regression line is not statistically significant and is not shown.

- Manganese Benchmark/Permit Limit
- Start of Woolsey Fire (11/8/2018)
- Outfall 001
- Outfall 002
- + Outfall 018
- Outfall 008
- Outfall 009

Figure 20. Timeseries of Manganese Concentrations 2012/13-2019/20

As illustrated in Figure 21a, manganese concentrations were highest at Outfall 001, which receives runoff from an undeveloped watershed. Figure 21b shows the detected particulate strengths were consistent across outfalls, indicating the differences in concentrations across outfalls were driven by TSS rather than a concentrated source. **The spatial pattern indicates that all outfalls likely shared the same diffuse, site-wide source of manganese in stormwater.**

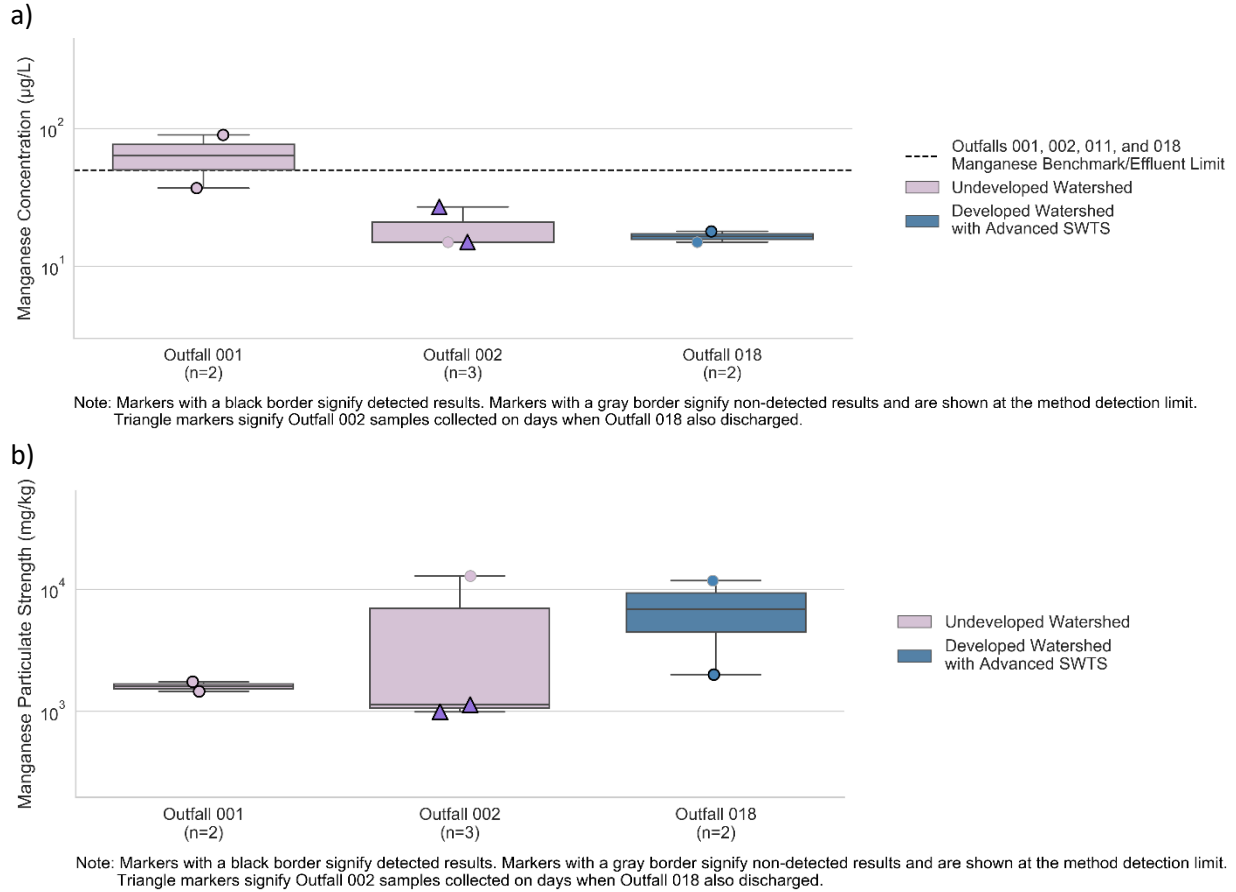

Figure 21. Manganese Concentrations at Outfalls in 2019/20 Compared to Previous Years

The PS of the outfall stormwater samples compared to the various potential sources are shown in Figure 22. The exceeding sample's PS is not below the upper range of any of the sources evaluated. Future analysis distinguishing between particle sizes in background soils is needed to determine if background soils, particularly in the fine fraction, are a contributing source. Research has found that manganese is strongly correlated with clay content (i.e., fine fraction; Ma et al., 1997), suggesting that the concentrations in background soils in the fine fraction may be higher than in bulk samples. **The PS values of the exceeding samples could not be explained by the source samples evaluated, but background soils could not be ruled out as a potential source due potentially elevated concentrations in soil fines.**

Note: Particulate strength values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red dot.

Figure 22. Manganese PS (2019/20 Outfall Stormwater Samples) vs. Solid Source Materials

The PS of manganese was compared against iron (both are soil-based) to evaluate if any of the stormwater and soil samples exhibited a similar pattern. Figure 23 shows that the exceeding stormwater sample fell on the background soil median slope line for background soils, which suggests that **background soils were a likely source of the manganese exceedance** in the 2019/20 rainy season.

Note: PS values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red border. Markers with a black border signify detected results that did not exceed a benchmark. Markers with a gray border signify an estimated PS where the dissolved fraction or TSS was not detected. Markers without a border signify an estimated PS where the constituent under evaluation was not detected in the sample and PS was calculated using the detection limit resulting in a high estimate.

Figure 23. 2019/20 Manganese:Iron Metal Ratio Plot

Chemical mass balance calculations were also conducted using copper, lead, and zinc heavy metal in addition to TCDD TEQ (no DNQ) particulate strength data for the potential source areas and the 2019/2020 outfalls. Additional TCDD analyses are discussed in the following section, but those data were used in the mass balance calculations to represent one of the four tracers need in the calculations. Table 8 illustrates the results of the chemical mass balance calculations to identify the major source contributions to the 001, 002, 008, and 009 outfalls. The calculated rankings of the relative contributions for these sources are indicated on the table. Only sources having at least 10% of the potential source contributions as the largest ranked source are ranked. Unranked sources are therefore likely to be only very small contributors to the outfall. Due to few data and relatively high variability, the reliability of these mass balances is fair for OF008 and 009, and good for OF001 and 002, indicating a moderate and low amount of uncertainty in the results, respectively. The major mass sources are seen to be the background soils (SSFL background soil and the ISRA in place soils). The watersheds are likely to have only small amounts of potential contributions of pavement fines and ISRA excavated soil material (although this material is no longer physically at the site, it is used as a proxy for potentially impacted soils).

Table 8. Chemical Mass Balance Calculation Results using 2019/2020 Copper, Lead, Zinc, and TCDD Particle Strength Data (source rankings shown)

	Pavement Fines	Santa Susana Field Lab background soil	ISRA in place soil	ISRA excavated soil	Reliability
OF001		1	2		good
OF002			1		good
OF008			1		fair
OF009			1		fair

3.5. TCDD TEQ (no DNQ)

The calculated TCDD TEQ (no DNQ) concentrations at Outfalls 001 and 002 were above the benchmark for these outfalls a total of three times in 2019/20. NPDES exceedances occurred in most years and the exceeding concentrations in the 2018/19 post-wildfire year were similar to non-wildfire years, as shown in Figure 24. Stormwater concentrations of TCDD TEQ (no DNQ) decreased over the course of the 2019/20 season at a similar rate as during the 2018/19 season. **Temporal patterns of TCDD TEQ (no DNQ) concentrations indicate that concentrations in 2019/20 were typical of pre-wildfire years for the site.**

Figure 24. Timeseries of TCDD TEQ (no DNQ) Concentrations 2012/13-2019/20

As shown in Figure 25a, concentrations of TCDD TEQ (no DNQ) were highest at Outfall 001, which receives runoff from an undeveloped watershed⁶. Figure 25b shows that the PS values of TCDD TEQ (no DNQ) were also highest at Outfall 001 indicating the results are PS driven rather than TSS driven. This suggests that there is likely a concentrated source in the Outfall 001 and 002 watersheds. Utility poles are suspected to be a contributing source of TCDD TEQ (no DNQ) to stormwater and are further evaluated through particulate strengths in Figure 26 below. While both Outfall 001 and 002 watersheds have a similar total number of poles, at the beginning of the rainy season there were fewer BMPs installed around utility poles

⁶ Although the median TCDD TEQ (no DNQ) concentration was highest at Outfall 001, the dataset is not sufficiently large to determine if this difference is statistically significant.

in the Outfall 001 watershed than the Outfall 002 watershed. This difference in BMP application may have contributed to higher concentrations of TCDD TEQ (no DNQ) at Outfall 001. Similarly, pavement solids have an elevated concentration of TCDD TEQ (no DNQ) and the Outfall 001 watershed has two stretches of paved roads adjacent to drainages (totaling approximately 2 acres) while Outfall 002 watershed has no paved areas. **The spatial patterns indicate there was likely a local source contributing to elevated TCDD TEQ (no DNQ) concentrations.**

Figure 25. Dioxins Concentrations at Outfalls in 2019/20 Compared to Previous Years

All of the exceeding samples had PS values about 100x higher than the average for all outfalls, at approximately 10^{-7} mg/kg TCDD TEQ (no DNQ) or greater, as shown in Figure 26. This indicates that the exceedances were driven by PS rather than TSS and possibly came from similar sources. The exceeding samples had PS values that could have come from pavement solids fines, impacted soils, soils near treated wood, and treated wood utility poles. Of these sources, pavement solids in the Outfall 001 watershed and soils near treated wood in the Outfall 001 and 002 watersheds had sufficiently high particulate strength (about 10x the exceeding samples), quantity, and mobility onsite to be significant contributors of TCDD TEQ (no DNQ) in stormwater runoff. Impacted soils could not be ruled out, however, they are unlikely to be the sole source of the exceedances due to the relatively small quantity of potentially impacted soils in the Outfall 001 and 002 watersheds and their distance from the Outfalls (if any are present, it would be in the northern most distant edge of the watersheds). Additionally, preliminary results of the buffer zone subarea study (Appendix E) found no elevated TCDD TEQ (no DNQ) in stormwater from potentially impacted soil subareas in the buffer zone. This indicates the **TCDD TEQ (no DNQ) exceedances in**

stormwater were likely from pavement solids fines (001 only) and/or soils near treated wood. Again, background soils could not be ruled out as a potential source due potentially elevated concentrations in soil fines.

Note: Particulate strength values of outfall samples whose stormwater concentration exceeded a permit benchmark or effluent limit are marked with a red dot.

Figure 26. Dioxins PS (2019/20 Outfall Stormwater Samples) vs. Solid Source Materials

The PS of TCDD TEQ (no DNQ) was compared against iron and manganese (which are soil-based) to evaluate if any of the outfall stormwater and soil samples exhibited a similar pattern. Figure 27 shows that the ratios found in the exceeding stormwater samples fall within the background soil 95% confidence interval, which supports background soils as a potential source of the TCDD TEQ (no DNQ) exceedances during the 2019/20 rainy season.

Note: PS values of outfall samples whose stormwater concentration exceeded a benchmark are marked with a red border. Not all exceeding samples have concurrent manganese samples. Markers with a black border signify detected results that did not exceed a benchmark. Markers without a border signify an estimated PS where the constituent under evaluation was not detected in the sample and PS was calculated using the detection limit resulting in a high estimate.

Figure 27. 2019/20 Dioxins Metal Ratio Plots

The TCDD TEQ values of the seventeen congeners and their percent contribution to the total TCDD TEQ sum in each potential source material were compared to the percent contribution of each in the stormwater samples using multivariate fingerprinting analyses. Cluster and principle component analyses were used to identify the likely major sources of TCDD congeners detected at the outfalls. The dendrogram in Figure 28 shows the relationships between outfall and source samples for the congeners. The dendrogram shows that pavement solids fines, background soils (Outfall 002 subarea, and SSFL background soils), and impacted soils have a strong relationship with the outfalls with samples that exceeded the benchmark (Outfalls 001 and 002). The principle component analysis further supports that stormwater at Outfalls 001 and 002 was closely related to background soils, impacted soils, and pavement solids fines, as shown in Figure 29. However, due to the absence of significant paved areas in the Outfall 002 watershed, pavements solids were not a likely source at Outfall 002. Impacted soils are unlikely to be a source of the exceedances due to the relatively small quantity of impacted soils in the Outfall 001 and 002 watersheds. This is supported by the preliminary results of the buffer zone subarea study, which found no elevated TCDD TEQ (no DNQ) in stormwater from impacted soil subareas in the buffer zone. Therefore, the cluster and principle component analyses support **pavement solids fines (001 only) and background soils as likely sources of the TCDD TEQ (no DNQ) exceedances in stormwater** during the 2019/20 rainy season.

Figure 28. Dendrogram of Dioxin Congener Relationships in Outfall Samples and Source Samples

Figure 29. Score Plot of the First and Second Principle Components for Dioxin Congeners

Table 9 shows the calculated mass contributions from the mass balance modeling using the TCDD congener data for the four potential sources for outfalls 001, 002, 008, 009, and 018. Due to the few and highly variable congener data for the potential sources, the reliability of these calculations is poor to fair,

with a moderately large uncertainty in these results. Most of the material reaching these outfalls are seen to be background soils (as reflected by the ISRA in place soil categories). The ISRA excavated soils and pavement fines are ranked second for these outfalls. As there is a large gap in the potential contributions between ranking values, these sources are not expected to be present in large small amounts.

Table 9. Chemical Mass Balance Calculation Results using 2019/2020 TCDD Congener Particle Strength Data (source rankings shown)

Outfall	Pavement Fines	Santa Susana Field Lab background soil	ISRA in place soil	ISRA excavated soil	Reliability
OF001			1	2	poor
OF002			1	2	poor
OF008	2		1		fair
OF009			1	2	poor
OF018	3		1	2	poor

These patterns were considered in conjunction with the PS values above to identify sources having both a high enough concentration of dioxin and the same pattern of congeners as observed in the stormwater samples. The samples that were supported by the congener fingerprinting also had high PS values, which further **supports the conclusion that background soils, and pavement solids fines (Outfall 001 only due to lack of pavement in the Outfall 002 watershed), were the likely sources of the TCDD TEQ (no DNQ) exceedances** during the 2019/20 rainy season. Although, the mass of pavement fines affecting the outfalls is likely very small compared to the background soils the concentration in pavement fines is 100x that in background soils. As discussed previously, impacted soils are unlikely to be a source of the exceedances at Outfalls 001 and 002. The various LOEs used to evaluate the source materials are summarized in Table 10 below.

APPENDIX C: 2019/20 Exceeding Constituent Source Investigation

Table 10. Summary of Dioxin Sources and LOEs (sources with most supporting LOEs are highlighted in orange)

Sample Location	Line of Evidence	Atmospheric Deposition	Pavement Solids	Soil Around Treated Wood	Impacted Soils	Background Soils
Outfall 001	Physically exists in watershed	✓	✓	✓	✓ ¹	✓
	Particulate strength ²	X	✓	✓	✓	✓
	Metal ratios support	N/A	N/A	N/A	N/A	✓
	Congener fingerprinting	Not analyzed	✓	X	✓	✓
	Subarea stormwater samples ³	N/A	Not sampled	N/A	X	✓
Outfall 002	Physically exists in watershed	✓	X	✓	✓ ¹	✓
	Particulate strength ²	X	NP	✓	✓	✓
	Metal ratios support	N/A	NP	N/A	N/A	✓
	Congener fingerprinting	Not analyzed	NP	X	✓	✓
	Subarea stormwater samples ³	N/A	NP	NA	X	X

KEY:

✓ = Line of Evidence supports material as potential source of dioxin exceedance

X = Line of Evidence does not support material as potential source of dioxin exceedance

N/A = Line of Evidence is not applicable to a particular source material

NP = A particular source material is not present in that watershed

Orange cells indicate sources that had no lines of evidence against being a potential source and were therefore the most likely sources of exceedance.

¹ Stantec analysis of soil data in watershed confirms presence of chemical constituents in shallow soil

² Supported if 90th percentile concentration in source sample is greater than exceeding particulate strength

³ Preliminary conclusions based off first season of subarea sampling. This analysis will be strengthened with more sampling results.

4. Conclusions

The evaluation of 2019/2020 exceedances was accomplished through the analyses described above. The various LOEs provide a collective weight of evidence to determine which constituents, if any, continue to be impacted by the wildfire and which sources most likely explain each benchmark exceeding constituent in the 2019/20 stormwater monitoring results.

The temporal patterns revealed that the concentrations in stormwater observed at SSFL this year are not characteristic of post-wildfire concentrations but rather, concentrations have returned to levels typical for non-wildfire year at the site. Similarly, the hydrologic response, analyzed through runoff volumes, have returned to patterns typical of non-wildfire years.

The spatial patterns revealed that the elevated iron, lead, and manganese concentrations were likely attributable to diffuse sources present throughout SSFL, while TCDD TEQ (no DNQ) concentrations were likely affected by contributions from local, watershed-specific sources such as pavement solids or soils near treated woods, in addition to diffuse site-wide sources such as natural background soils. Additionally, impacted soils could not be ruled out as a potential source for dioxin exceedances; however, as shown in Appendix E, results of initial stormwater sampling data collected from subareas of the Outfall 001 and 002 watersheds suggest that the few impacted soil areas within these watersheds are not contributing dioxin to these outfalls at levels greater than background soils. More data are needed to confirm this finding over ensuing years.

Multiple LOEs pointed to natural background soils as likely sources of most of this year's exceedances. In most cases, one or more of the potential source materials evaluated was determined to be a potential source of the exceeding constituent found in stormwater. A summary of these analyses is presented in Table 11.

APPENDIX C: 2019/20 Exceeding Constituent Source Investigation

Table 11. Summary of LOEs by Outfall and Constituent

Parameter	Outfall (# of exceedances)	Temporal Pattern	Spatial Pattern	Outfall Particulate Strengths vs Solid Sources	Fingerprinting		Chemical Mass Balance ¹	Subarea Stormwater Particulate Strengths (PRELIMINARY) ²
					Comparison to Soil Fe and Mn Ratios	Congener Fingerprinting		
Iron	001 (3)	Typical of non-wildfire conditions	diffuse/site-wide source	<i>Additional data needed³</i>	natural background soils	N/A	natural background soils	diffuse/site-wide source, natural background soils
Iron	002 (3)	Typical of non-wildfire conditions	diffuse/site-wide source	<i>Additional data needed³</i>	natural background soils	N/A	natural background soils	diffuse/site-wide source, natural background soils
Lead	001 (1)	Typical of non-wildfire conditions	diffuse/site-wide source	atmospheric deposition, pavement solid fines, natural background soils	natural background soils	N/A	natural background soils	diffuse/site-wide source, natural background soils
Manganese	001 (1)	Typical of non-wildfire conditions	diffuse/site-wide source	<i>Additional data needed³</i>	natural background soils	N/A	natural background soils	diffuse/site-wide source, natural background soils
TCDD TEQ (no DNQ)	001 (2)	Typical of non-wildfire conditions	local/watershed-specific source	soil near treated wood, potentially impacted soils, natural background soils, pavement solid fines	natural background soils	pavement solid fines, natural background soils	natural background soils	diffuse/site-wide source, natural background soils
TCDD TEQ (no DNQ)	002 (1)	Typical of non-wildfire conditions	local/watershed-specific source	soil near treated wood, potentially impacted soils, natural background soils	natural background soils	natural background soils	natural background soils	diffuse/site-wide source, natural background soils

1. Chemical mass balance calculations considered copper, lead, zinc, and TCDD TEQ (no DNQ) concentrations at once rather than an individual constituent at a time.

2. Buffer zone subarea sampling conclusions are preliminary. More data, which will be obtained through additional sampling, are needed to confirm these conclusions.

3. Additional sampling with analysis by size fraction is recommended in order to evaluate potential sources since none of the bulk solids concentration met the threshold to be likely source.

1. Introduction

The purpose of this memorandum is to evaluate the performance of existing stormwater treatment Best Management Practices (BMPs) in the Outfall 009 watershed of the Boeing Santa Susana Field Laboratory (Site). The BMPs have been installed at the direction of the Surface Water Expert Panel and have been in operation since 2011. The purpose of these BMPs is to reduce pollutants from stormwater prior to discharge at Outfall 009 to comply with the NPDES permit standards as issued to Boeing by the Los Angeles Regional Water Quality Control Board.

This is an update to the BMP performance analysis that is conducted annually, consistent with the *Site-Wide Stormwater Work Plan and 2014/15 Annual Report* ("2015 Work Plan") (Santa Susana Surface Water Expert Panel and Geosyntec Consultants, 2015). This memorandum incorporates 2019/2020 reporting year data into a dataset that initially began in December 2009. The National Pollutant Discharge Elimination System (NPDES) constituents of concern (COCs) addressed in this analysis include total suspended solids (TSS), total lead, total copper¹, and dioxins (TCDD TEQ, DNQ excluded, BAFs included). 2019/2020 data were collected to assess effectiveness of the culvert modification (CM) installations², upper lot media filter, lower parking lot sedimentation basin and biofilter (lower lot biofilter), ELV treatment BMP³, and B1436 detention bioswales⁴ (detention bioswales), and Boeing administrative area inlet filters (Boeing admin area inlet filters). This memorandum focuses on the performance of the BMPs listed above, which are located in Watershed 009. Although this memorandum currently only addresses BMPs in Watershed 009, Table 1 shows Permit Limits at all outfalls specified in the NPDES Permit for the aforementioned COCs, as context for goals for other potential BMPs constructed in other watersheds, if needed in the future.

Table 1. COC NPDES Permit Limits by Outfall

Outfall	NPDES Permit Limit			
	TSS (mg/L)	Total Lead (µg/L)	Total Copper (µg/L)	Dioxins (µg/L)
001	45	5.2	14	2.80 x 10 ⁻⁸
002	45	5.2	14	2.80 x 10 ⁻⁸
003	-	5.2	13	2.80 x 10 ⁻⁸
004	-	5.2	13	2.80 x 10 ⁻⁸
005	-	5.2	13	2.80 x 10 ⁻⁸
006	-	5.2	13	2.80 x 10 ⁻⁸
007	-	5.2	13	2.80 x 10 ⁻⁸
008	-	5.2	14	2.80 x 10 ⁻⁸

¹ Copper is not included as a pollutant of concern for the Outfall 009 watershed in the 2015 Work Plan. However, data for total copper are retained for the paired line plots.

² CM refers to a culvert modification BMP where detention and stormwater filtration occurs prior to entering culverts beneath roadways.

³ ELV refers to an area previously used by NASA to test the lunar lander engines.

⁴ Includes both the northern and southern detention bioswales. However, only the southern detention bioswale was sampled in 2017/2018, 2018/2019, and 2019/2020.

Outfall	NPDES Permit Limit			
	TSS (mg/L)	Total Lead (µg/L)	Total Copper (µg/L)	Dioxins (µg/L)
009	-	5.2	13	2.80 x 10 ⁻⁸
010	-	5.2	13	2.80 x 10 ⁻⁸
011 ¹	45	5.2	14	2.80 x 10 ⁻⁸
018 ¹	45	5.2	14	2.80 x 10 ⁻⁸
019	45	5.2	14	2.80 x 10 ⁻⁸
020	45	5.2	14	2.80 x 10 ⁻⁸

¹ Benchmark

Following the 2016/2017 reporting year, it was decided that BMP performance sampling would be reduced because of the recent slow-down in site activities particularly in the Outfall 009 watershed. Starting in 2017/2018, samples were only collected during two storm events per year at the upper lot media filter, southern detention bioswale, lower lot biofilter, CM-1 (influent-west and effluent), and the ELV Treatment BMP.

During 2019/2020, there was slightly higher than average total precipitation as compared to other reporting years. Long-term average annual rainfall at SSFL from 1958/1959 through 2019/2020 is 17.0 inches⁵, compared to 20.54 inches recorded in 2019/2020⁶. Nine rain events⁷ occurred in the 2019/2020 reporting year, with six of these storms being sampled at one or more BMP monitoring sites⁸. This is compared with between four and 14 total rain events per year in prior reporting years 2009/2010 through 2018/2019.

Table 2 summarizes rainfall events in which data were collected for the 2009/2010 through 2019/2020 reporting years (“non-qualifying rain events” represent precipitation events where samples were not collected). Not all BMPs had influent and effluent flows during each rain event.

⁵ Data from the Simi Hills – Rocketdyne Lab gauge (Ventura County Watershed Protection District site 249) was used to determine annual rainfall from 1958/1959 through 2000/2001. However, rainfall data were not available at this gauge from 1977/1978 through 1984/1985. Data from the Area 4 gauge (which was moved to Area 1 on January 1, 2013) were used to determine annual rainfall from 2001/2002 through 2019/2020. This results in a period of record (POR) of 54 years.

⁶ A water year is typically defined as October 1 through September 30. However, due to the reporting timeline for the Annual Report, reporting years have been defined as June 1 through May 31.

⁷ A “rain event” is defined as greater than 0.1 inches of rainfall in a 24-hour period and preceded by at least 72 hours of dry weather.

⁸ Monitoring occurs when rain events result in observable flow and the maximum number of sampled events planned for the particular BMP has not been reached.

Table 2. Sample Collection Event Rainfall Data Summary
 (gray cells indicate dates that did not have complete data pairs sampled at treatment devices)

Date(s)	Average Intensity (in/hr)	Max Intensity (in/hr)	Event Total (in)	Event Duration (hrs)	Cumulative Rainfall for Sampled Events (in)	Number of BMP Subarea Monitoring Samples ¹
10/13/2009 - 10/14/2009	0.05	0.24	2.48	35	2.48	- ¹

¹ Includes total samples (influent, effluent, BMP subarea, background, etc.). Annual totals only are shown for early reporting years (as available), consistent with what was reported in past annual reports.

² Rainfall was measured, but not considered a rain event per the NPDES definition.

³ Area I weather station malfunctioned during rain event, rainfall totals from Station 436 used but hourly rainfall not available.

⁴ Rainfall from Station 436 was used for hour 3:00 on 10/16/2016 when the Area I station was off-line.

2. Overview

2.1 BMPs

Influent and effluent results for each stormwater BMP for the same storm event were compared to assess concentration reductions through the system. Although split samples were periodically collected and used for QA/QC purposes, only the primary samples were used in these analyses. For each of the **six CM sites** discussed herein⁹, the number of paired samples per BMP ranges from 3 to 37 pairs for TSS, 0 to 37 pairs for dioxins¹⁰, 0 to 37 pairs for lead¹¹, and 0 to 33 pairs for copper¹² for 2011/2012 through 2019/2020. Seven new CM paired samples¹³ were collected during this reporting year, and it should be noted that sampling at the B-1 media filter ceased after the 2015/2016 reporting year due to sufficient data having been collected to quantify performance. However, periodic visual checks are made at all control locations to indicate any maintenance problems. The road runoff diversion to CM-1 was constructed during 2017/2018, and sampling to characterize road runoff influent to CM-1 began in 2018/2019. The road runoff inlet to CM-3 was completed on May 5, 2017. No effluent samples were collected during the one post-construction event during 2016/2017, no samples were collected in 2017/2018, and no effluent samples were collected during the one sampled event in 2018/2019. Paired influent and effluent data were collected for the first time in 2019/2020 (for three events). For two of these events, the influent sample included undeveloped area influent to CM-3. For one of these events, road runoff influent was sampled, in addition to undeveloped area influent to CM-3 (results from both locations were flow-weighted [based on drainage area size and estimated imperviousness] to determine the influent concentration).

Performance data for the **lower lot biofilter** (construction of which was completed in 2013) were collected from three locations within the system (influent, effluent, and a mid-point sample at the sedimentation basin outlet before the media filter inlet) during two storm events in the 2019/2020 sampling year. As a result, there are 28 total sample pairs associated with this location to date, including

⁹ Includes CM-1, CM-3, CM-8, CM-9, CM-11, and B-1. CM-3 pre-2016/2017 was excluded from this analysis due to post-storm dry weather flows observed at the outlet between February 2010 and March 2011 when no flows were observed entering the culvert, suggesting subsurface inflows were contributing to effluent samples, thus limiting the meaningfulness of an influent-effluent comparison. However, the road runoff inlet to CM-3 was completed on May 5, 2017. Therefore, CM-3 data starting in 2016/2017 are included in this memorandum. This includes single influent results for CM-3 road runoff from one event in 2016/2017 and one event in 2018/2019, in addition to paired influent and effluent data for three events in 2019/2020 (influent data also includes undeveloped area influent to CM-3).

¹⁰ There are no data pairs for dioxins at CM-8. Excluding CM-8, the lowest number of data pairs is three (CM-3).

¹¹ There are no data pairs for lead at CM-11. Excluding CM-11, the lowest number of data pairs is three (CM-3).

¹² There are no data pairs for copper at CM-8 and CM-11. Excluding CM-8 and CM-11, the lowest number of data pairs is three (CM-3).

¹³ CM-1 was sampled during three events in 2019/2020 but paired (influent and effluent) samples were only collected during two of these events. Three paired samples were collected at CM-3 in 2019/2020. CM-9 was sampled during three events in 2019/2020 but paired (influent and effluent) samples were only collected during two of these events.

one 2013/2014 biofilter effluent sample reflecting a blend of filtered underdrain flows and overflows that bypassed the filter media.

Performance data for the **ELV treatment BMP** (implemented during the 2013/2014 reporting year) includes paired data from 12 events through 2019/2020¹⁴. These data are shown in the paired line plots and statistical analyses in the following sections, though it should be noted that it is possible that the media bed for this system may have been flushing fines during the first sampling event in 2013/2014 since this was the first rain event it experienced. During this event, the ELV treatment BMP was also heavily loaded by sediments eroded from the denuded ELV channel prior to implementation of erosion control improvements. Recent data have also shown evidence of solids export through the underdrain, based on the dioxins particulate strength decreasing through the media layer.

The **B1436¹⁵ detention bioswales** (construction of which was completed in December 2014), were sampled for the first time during the 2015/2016 reporting year¹⁶. The detention bioswales are intended to capture and slowly release flow to the downstream lower lot biofilter, thus attenuating peak flowrates and distributing them over a longer period of time allowing more opportunity for the biofilter to treat these flows. Using the site-wide Stormwater Management Model (SWMM), the time period after completion of the detention bioswales (11/1/14) until 4/1/19 was simulated with and without the bioswales to estimate the increased biofilter runoff capture efficiency (i.e., the volume of treated water divided by the total runoff draining to the biofilter) due to implementation of the bioswales upstream. The model shows that installing the bioswales has increased the biofilter runoff capture efficiency from 59% to 73% (a 24% increase). When only considering the runoff from the lower parking lot (a priority treatment area), the runoff capture efficiency from this area has increased from 80% to 88% (a 8% increase).

Excellent treatment occurs in the bioswales, although the primary purpose was to slow the influent runoff to the lower lot biofilter and reduce flows that bypasses the lower lot biofilter during large storm events. Samples were collected at three locations at the southern detention bioswale, which includes two influent locations (results from both locations were flow-weighted [based on drainage area size and estimated imperviousness] to determine the influent concentrations) and the effluent. Paired influent and effluent performance data were collected during 19 events at the southern detention bioswale prior to the current reporting year, and two sample pairs were collected during 2019/2020, for a total of 21 sampled events through 2019/2020. Samples were also collected at both the influent and effluent locations of the northern detention bioswale during eight events during the 2015/2016 and 2016/2017 reporting years. Sampling was discontinued at the northern detention bioswale after the 2016/2017

¹⁴ The ELV treatment BMP has paired data from 12 events to date for TSS, dioxins, and lead. There are 11 data pairs for copper. Due to a power outage during the Woolsey wildfire, the ELV treatment BMP was not operational during 2018/2019 and therefore additional performance samples were not collected during the 2018/2019 reporting year. A generator has since been added at this location as the primary power source.

¹⁵ B1456 refers to a former building at this location that was demolished by Boeing as part of its effort to remove man-made structures at SSFL.

¹⁶ The effluent of the northern detention bioswale (ILBMP0007) was sampled in the 2014/2015 reporting year (May 2015). However, a paired influent sample was not collected during this event.

reporting year, as it was determined that sufficient data were collected at that location and the performance data for the detention bioswales are represented in the southern section.

Eight samples were collected from the **upper lot media filter** (construction of which was completed on May 16, 2017) during the 2016/2017 reporting year, but only at the influent location. Paired samples were collected for the first time at the upper lot media filter during 2017/2018 (for two events), and paired samples were collected during four events during the 2018/2019 reporting year¹⁷ and two events during the 2019/2020 reporting year.

The **Boeing admin area inlet filters** (filter basket with targeted media mix) were installed in 2017. The Boeing admin area inlet filters were sampled for the first time during the 2018/2019 reporting year (an influent and effluent sample were collected during one event). The filter lip was sealed in April 2019 to prevent bypass, but the samples from the 2018/2019 reporting year were collected before the lip was sealed. Paired samples were collected at the Boeing admin area inlet filters during two events during 2019/2020.

Table 3 shows a summary of the BMPs discussed herein, including various BMP characteristics/components and which implemented BMPs include the various components.

Table 3. BMP Summary

BMP Characteristic	BMP						
	CM Sites	B1 Media Filter	Upper Lot Media Filter	Lower Lot Biofilter	ELV Treatment BMP	Detention Bioswales	Boeing Admin Area Inlet Filters
Media filtration-based ¹	x	x	x	x	x		x
Subsurface storage-based						x	
Significant pretreatment incorporated		x		x	x		
Outlet controls				x	x	x	
Vegetation				x		x	
Vertical flow regime		x	x	x	x	x	x
Horizontal flow regime	x	x	x				

¹ Using the SSFL sand, zeolite, and granulated activated carbon (GAC) media mixture.

2.2 Sampling

Influent grab samples are collected from flowing surface water upstream of the maximum extent of ponding at each CM as observed before that date¹⁸. All sampled CMs include a media filter and a slipline

¹⁷ The upper lot media filter was also sampled during an additional event in 2018/2019, but only an effluent sample was collected (no paired influent sample).

¹⁸ When the extent of ponding increased at the CM-1 and CM-3 culvert basins on December 22, 2010 during a heavy rainfall, the influent sample locations were moved upstream a sufficient distance to remain above the maximum ponded water footprint.

HDPE lining through existing galvanized corrugated metal culvert pipes (zinc is not a COC at SSFL) with the exception of B-1, which is a media bed with no slipline element. Effluent grab samples at CM-1, CM-9, and B-1 are collected from the underdrain outlet (beginning in October 2011, rather than the culvert outlet), while other CM effluent grab samples are collected at the culvert outlets on the downstream side of the road, where the culvert pipes discharge to the Northern Drainage. Flows from the culvert outlets may represent treated runoff (via sedimentation and media filtration) and partially treated runoff (flowing through or over the weir boards); this is noted on the plots. At CM-3, the slipline HDPE pipes were inserted from both the influent and effluent sides and could not be sealed at the point where they meet, and subsurface flows through the road embankment are known to have entered the pipe during rain events from February 2010 through March 2011 because water was observed discharging from the HDPE pipe outlet when no water was flowing into the inlet. Therefore, CM-3 performance cannot be reliably assessed due to this bypassing of the media filter and sampling at this site was discontinued after the 2010/2011 reporting year. However, sampling was initiated during 2018/2019 after completion of the road runoff inlet and new sliplining, as previously described. Sampling to characterize road runoff influent to CM-1 began in 2018/2019.

At the lower lot biofilter, influent samples are collected in the cistern discharge pipeline, the mid-point samples are collected at the sediment basin outlet box, and effluent samples are collected from the discharge of the biofilter effluent pipe. The Boeing admin area inlet filters influent and effluent samples are collected from the filter basket influent and effluent, respectively. Influent samples for the southern detention bioswale are collected from both the east and west portions of the concrete swale diverting sheetflow into the rock crib, and effluent samples are collected from the underdrain. Influent samples for the northern detention bioswale were collected from the curb cut along the east side of the bioswale, and effluent samples were collected from the bioswale underdrain. For the ELV treatment BMP, influent samples are collected from the influent pipe, mid-point samples are a composite of samples from the eastern and western sample ports between the settling tanks and media filter, and the effluent samples are collected from the effluent pipe from the middle tank.

2.3 Drainage Areas

Several CM/media filter locations (CM-1, CM-9, CM-3, the B-1 media filter, and the upper lot media filter) and the southern detention bioswale have multiple influent drainage areas:

- CM-1 receives runoff from an eastern tributary that is considered to reflect background concentrations, a western tributary comprising paved road and ELV hillside runoff (ELV hillside runoff is only reflected in samples collected prior to November 2013), and another area mainly comprised of road runoff;
- CM-9 receives runoff from the Area I Landfill (A1LF) and former Building 1324 parking lot (demolished Summer/Fall 2011), as well as the paved road to the east (Area II road);
- B-1 receives runoff from the north, comprised of paved road runoff, and the south, comprised of the upper B-1 ISRA areas, the sedimentation basin, and paved road runoff.
- The southern detention bioswale receives runoff discharged from the rock crib swale and the paved area adjacent to the detention bioswales (contractor laydown area).

- The upper lot media filter receives runoff from the south/southeast of the road, which is predominately comprised of the hillside, and the southwest (via the culvert), which consists of both the parking lot and hillside.
- CM-3 receives runoff from the hillside south of the road (including a clean soil borrow area at the top of the watershed), in addition to a small portion of the road runoff (after the road runoff inlet was completed in May 2017).

Influent locations used in the paired analyses were evaluated on a case by case basis, with similar sample dates taking precedence (between influent and effluent); in instances when two or three influent samples were available for the same effluent-sampling storm event, an impervious area-weighted average (used as an estimate of proportioned flowrate from each influent stream) was used to represent a single composite influent value.

Background monitoring sites at CM-1 (influent-east), CM-3, CM-8, and CM-11 receive runoff from drainage areas that do not include any known historic industrial activities, although the CM-3 drainage area does include a clean soil borrow area at the top of the watershed. Therefore, influent sample results at these four CM locations (not including CM-1 influent-west, or CM-3 road runoff) are of relatively good quality and considered reflective of “background” stormwater concentrations, making it difficult to achieve additional COC reductions through these CMs. These “background” CM locations were therefore statistically evaluated separately from the other CM locations. Sampling at these background CM locations was discontinued following the 2010/2011 reporting year, with the exception of the road runoff inlet to CM-3, which was completed in May 2017 and sampling was initiated again during the 2016/2017 reporting year. The road runoff diversion to CM-1 was constructed during 2017/2018, and sampling to characterize road runoff influent to CM-1 began in 2018/2019.

The BMPs discussed in this memo and their respective drainage areas are shown in Table 4. The approximate percent impervious cover and portion of the drainage area burned during the Woolsey Fire is also shown in Table 4, for each BMP. While these areas are discussed specifically with respect to performance monitoring data, there are other areas of the SSFL site which are also addressed by BMPs, including CMs, asphalt removal, erosion control, and treatment control BMPs.

Table 4. BMP Sites and Drainage Areas

BMP	Drainage Area (acres)	Approximate Impervious Cover (%)	Approximate Portion of Drainage Area Burned by Woolsey Fire (%)
CM-1	52.8 (pre-ELV improvements)	6.5	87
	45.4 (post-ELV improvements)	10	
CM-3	16.6	6	89
	0.25 (road runoff)	100	0
CM-8	2.6	36	11
CM-9	10.2	48	0
CM-11	5.7	26	31
B-1 Media Filter	8.6	53	0
ELV Treatment BMP	15.6 (Helipad plug in place)	26	0
	6.6 (Helipad plug removed)	37	
Lower Lot Biofilter	29.9 ¹	53	38 ²
Northern Detention Bioswale	2.6	50	31
Southern Detention Bioswale	14.2		60
Upper Lot Media Filter	5.1	35	2
Boeing Admin Area Inlet Filters	0.86	82	0

¹ A portion of the 24-inch stormdrain drainage area is diverted to the lower lot biofilter for treatment. As a result, the percent of runoff volume captured and treated from the smaller (approximately 11.7 acre) lower lot drainage area is greater than the percent of long-term runoff volume captured and treated from the larger (approximately 18.2 acre) 24-inch stormdrain drainage area. The average impervious cover of the smaller lower lot drainage area of 11.7 acres is 60%.

² Represents the portion of the smaller lower lot drainage area (11.7 acres) that was burned.

Regarding COCs entering the BMPs following the Woolsey fire, elevated influent concentrations post-fire were observed for all four analytes (lead, TSS, copper, and dioxins) at CM-1¹⁹. CM-9 also exhibited higher influent concentration following the Woolsey fire, even though the drainage area was not burned, but the increases in influent concentrations were less than with CM-1²⁰. Elevated concentrations were also observed post-fire for dioxins only at the ELV treatment BMP and TSS only at the upper lot media filter²¹. Significant changes in influent concentrations were not observed pre vs. post fire at the southern detention bioswale, CM-3, or the lower lot biofilter, all of which had significant portions of the drainage area burned. Effects related to the Woolsey fire were discussed in more detail in the 2018/2019 annual report.

¹⁹ Influent concentrations pre vs. post fire at CM-1 are 24 vs. 40 mg/L for TSS, 2.9E-08 vs. 1.3E-05 µg/L for dioxins, 1.8 vs. 3.7 µg/L for lead, and 2.9 vs. 3.9 µg/L for copper.

²⁰ Influent concentrations pre vs. post fire at CM-9 are 27 vs. 44 mg/L for TSS, 6.4E-08 vs. 7.9E-08 µg/L for dioxins, 7.3 vs. 11.7 µg/L for lead, and 6.6 vs. 8.8 µg/L for copper.

²¹ Influent concentrations pre vs. post fire at the ELV treatment BMP are 1.0E-08 vs. 1.8E-07 µg/L for dioxins. Influent concentrations pre vs. post fire at the upper lot media filter are 15 vs. 30 mg/L for TSS.

3. Paired Line Plots

The log-scale line plots presented in this section illustrate the changes in measured concentrations between influent and effluent sample pairs at each treatment BMP. Paired data were obtained from CM/media filter locations B-1, CM-1, CM-3, CM-8, CM-9, CM-11, and the upper lot media filter, the ELV treatment BMP, the lower lot biofilter, the detention bioswales, and the Boeing admin area inlet filters. Data are presented by COC in Figure 1 through Figure 63, where paired data measured during the same event are represented by two points (influent and effluent) connected by a line, and single sample results (where either an influent or effluent sample were not collected for a single event) are shown by single points without any connected line. Points and lines are shaded based on the sampling year during which they were collected, where black lines and points represent data from the most recent 2019/2020 reporting year and data from all previous reporting years are shown in gray. In addition, different symbology is used for different influent and effluent sample collection locations, as defined on each graph. Additionally, non-detect results are displayed as the detection limit. The detection limit may vary slightly from year to year, but the typical detection limit is also shown as a black dotted line. The statistical analyses of the datasets are presented in Section 4.

In addition to evaluating BMP performance, the monitoring data have also been used in the site selection evaluations for consideration for enhancements to selected CMs for improved performance in areas where the effluent remains problematic. This was the case at CM-9 based on historical results, and upgradient improvements were added in 2013. Other examples of improvements include asphalt removal in the upper drainage area and filter fabric installation over the weir boards. For sites that were subject to such improvements impacting the quantity or quality of contributing runoff, separate graphs are shown for sample results that occurred before and after the improvements were made. At the B-1 media filter site, media washout was observed during initial sampling dates in the 2011/2012 reporting year. Results collected during this period were removed from the analysis. Additionally, preliminary samples were collected from the lower lot biofilter in 2012/2013 before the system was fully functional. These results were also removed from the complete analysis.

Monitoring data were first collected at the ELV treatment BMP during the 2013/2014 reporting year; since that was the first rain event that the system experienced. The monitoring data reflect media fines being washed from the system. In addition, during the February/March 2014 storm event, a plug in the storm drain under Helipad Road resulted in high flows from the Helipad Road being routed to the ELV sump and treatment system. Additionally, inadequate erosion controls along the earthen ELV channel resulted in sediment filling the sump, and a power outage resulted in the sump pump turning off. The influent-effluent pollutant concentration reduction performance of the ELV Treatment BMP is not expected to be affected by these conditions; however, the fraction of runoff volume captured from the ELV drainage area during each storm is expected to be reduced due to these factors. Although no overflow events as described previously were observed during the 2014/2015 reporting year, this plug was not removed for any storm events. Samples were not collected at the ELV treatment BMP during the 2018/2019 reporting year due to a long-term power failure associated with the Woolsey Fire, which destroyed the electrical infrastructure. To prevent future power outages at the ELV treatment location, a generator was added to the ELV system as the main power source, since electrical lines were not replaced in this area to reduce the risk of future fires. A portable generator is also on hand for the biofilter cistern pump as a backup power supply.

With regards to the line plots, the BMP effectiveness during events having influent concentrations above the outfall Permit Limit is the most important performance criterion since those below the Permit Limit are already of acceptable quality and are generally considered to be at levels unlikely to be further reduced using typical stormwater controls, especially considering the conditions that have been experienced to date in terms of precipitation and watershed erosion. However, the data were reviewed for these conditions to document any concentration increases due to media failure or washout. As with most stormwater quality controls, the water quality percentage improvements are the most substantial when the influent concentrations are high. This is because it is difficult to further reduce low concentrations, due to equilibrium concentrations with the media, media washout, resuspension of silts, etc.

These charts are included for general visual assessment purposes only; the statistical tests in later sections are used to make quantitative evaluations of BMP performance. It should be noted that the samples collected at the stormwater controls are all grab samples. Stormwater quality can be highly variable during storms and grab samples may represent collection times that vary throughout the storm event hydrograph. Therefore, relatively large numbers of samples for many storms are needed to represent the varying overall conditions with reasonable statistical confidence and power. The line and probability plots illustrate the influent and effluent variable concentrations.

Six CM effluent samples were collected during overflow/bypass conditions (over all reporting years) based on available field notes. These conditions are noted on the plots with red markers. No other sampling dates were noted as having overflows in the available field notes. In addition, observations of weir board overflows were collected starting in the 2011/2012 reporting year. It is unknown which prior samples, if any, were collected during overflow conditions. Sampling notes, which now more carefully track this information, have not noted any samples collected under overflow/bypass conditions since the 2011/2012 observations.

3.1 TSS Paired Line Plots

Figure 1. TSS at CM-1, pre filter fabric installation (filter fabric installed on 1/20/2012)

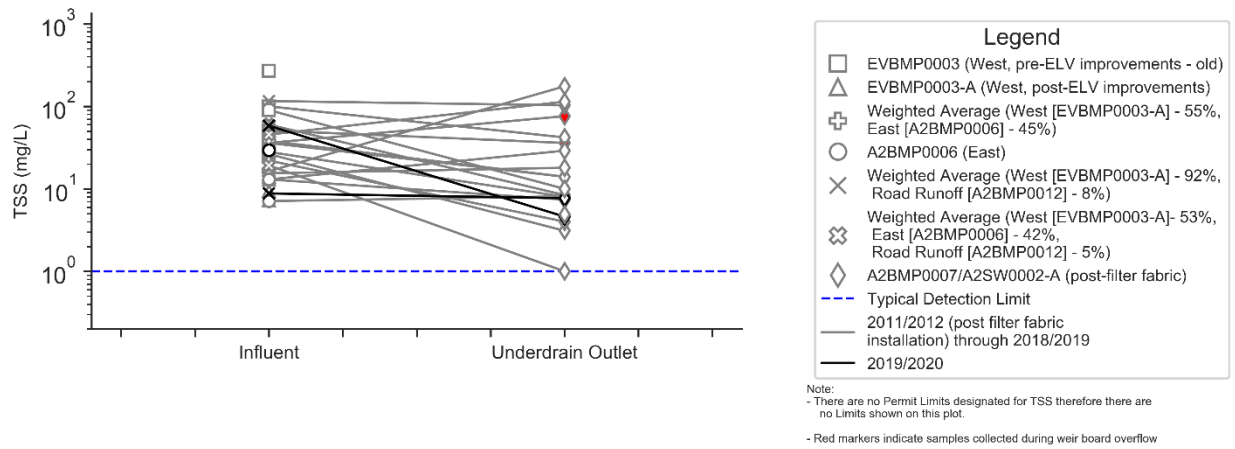

Figure 2. TSS at CM-1, post filter fabric installation (filter fabric installed on 1/20/2012)

Figure 3. TSS at CM-3²²

²² CM-3 was reconstructed midway through the 2019/2020 reporting year. The sampling event with weir board overflow (as shown by the red marker) occurred before CM reconstruction, and the two sampling events with increases in TSS concentration occurred following CM reconstruction and occurred when the influent TSS concentrations were very low.

Figure 4. TSS at CM-8

Figure 5. TSS at CM-9, pre improvements (removal of A1LF asphalt [9/1/2011] and addition of CM weir board filter fabric [1/20/2012])

Figure 10. TSS at ELV Treatment BMP

Figure 11. TSS at Lower Lot Biofilter²³

Figure 12. TSS at Southern Detention Bioswale

²³ A sample was not taken at the biofilter inlet (post-sedimentation basin) during the 2013/2014 sampling year due to the sample location being submerged and inaccessible. The biofilter outlet sample from the 2013/2014 reporting year reflects a mix of filtered underdrain flow and unfiltered overflow.

Figure 13. TSS at Northern Detention Bioswale

Figure 14. TSS at Upper Lot Media Filter

3.2 Dioxins Paired Line Plots

Figure 16. Dioxins at CM-1, pre filter fabric installation (filter fabric installed on 1/20/2012)

Figure 17. Dioxins at CM-1²⁴, post filter fabric installation (filter fabric installed on 1/20/2012)

²⁴ A leaking seal was noted at CM-1 on 3/3/2017. It is unclear if this condition was present during the 2/17/2017 sample that resulted in an exceedance of permit limits for dioxins. Additionally, unusually high influent concentrations were observed during some sampled events in recent reporting years. The road runoff diversion to CM-1 was constructed during 2017/2018, and sampling to characterize road runoff influent to CM-1 began in 2018/2019. Sampled events (during 2018/2019 and 2019/2020) where the road runoff location was sampled had higher influent dioxins concentrations. Therefore, the higher influent concentrations are likely due to road runoff contributions (which include several treated wood utility poles).

Figure 24. Dioxins at ELV Treatment BMP

Figure 25. Dioxins at Lower Lot Biofilter²⁵

Figure 26. Dioxins at Southern Detention Bioswale

²⁵ Effluent result from the 1/8/18 - 1/9/18 event is not consistent with past performance observed from the biofilter, therefore the performance and effluent concentrations will be evaluated during subsequent monitoring events to make sure the biofilter is performing as designed. Additionally, the effluent result from 12/6/2018 may have been due to a power outage resulting in manual pumping from the cistern to the sediment basin, which could have overloaded the biofilter.

4. Statistical Analysis

Statistical summaries of the Site cumulative paired data over the 2009-2020 sampling period using the non-parametric one-tailed sign test are shown for the paired datasets in Table 4 through Table 12. This test is used to evaluate statistical differences between paired data points, or in this case, between influent and effluent stormwater samples. The null hypothesis is that the number of data pairs showing an increase from influent to effluent concentrations equals the number of data pairs showing a decrease in concentration from the influent to effluent samples. If the p-value is less than 0.05, the null hypothesis is rejected with a 95 percent level of confidence. Rejection of the null hypothesis results in a statistically significant difference in the number of data pairs that show an increase in concentration from the influent to effluent and data pairs with a decrease in concentration from influent to effluent. If the p-value is greater than 0.05, there are insufficient numbers of paired data sets to indicate a significant difference. For this analysis, data pairs that were taken during observed bypass/overflow events were removed (specific locations, events, and rainfall characteristics were listed previously in Section 3). A statistical analysis is not performed on the Boeing admin area inlet filters because only three data pairs are currently available.

4.1 Culvert Modification/Media Filter Areas

At the monitored CMs and media filters (B-1, CM-1, CM-3, CM-8, CM-9, CM-11, and the upper lot media filter), the total number of combined influent and effluent data pairs ranged from 100 (for dioxins) to 117 (for TSS)²⁷. Table 4 and Table 5 summarize the paired data statistics for these locations. CM-8, CM-11, and select CM-1 paired statistics are presented separately from the other locations (Table 5) since the influent flows to these sites come largely from background sites, and therefore significant reduction of the COC concentrations (which are generally very low) in those flows by CMs is unlikely. No paired data were collected from these background sites in the 2019/2020 reporting year. Data from the CM-3 background site (pre-2016/2017) were excluded since post-storm dry weather flows were observed at the outlet between February 2010 and March 2011 when no flows were observed entering the culvert, suggesting subsurface inflows were contributing to effluent samples. Therefore, this CM cannot be reliably assessed based on the effluent sample results (pre-2016/2017). Samples collected for road runoff to CM-3 during 2019/2020 are included in the statistical analyses²⁸.

At the B-1 media filter site, media washout was observed during initial sampling dates in the 2011/2012 reporting year. Since this was a malfunction that was subsequently corrected, results from these sample dates were removed from the analysis. The CM-1 effluent sample collected on 2/28/2014 represented a blend of underdrain flow and seepage through the upstream weir boards. A leaking seal was noted at CM-1 on 3/3/2017. It is unclear if this condition was also present during the 2/17/2017 sample that resulted in an exceedance of permit limits for dioxins. These results were included in the analysis.

²⁷ Because copper is not included as a pollutant of concern in the Expert Panel Work Plan for watershed 009, which was submitted to the Regional Board in September 2015, results for copper are not included herein.

²⁸ Samples for road runoff to CM-3 from 2016/2017 and 2018/2019 are not included in the statistical analyses because an influent/effluent data pair was not collected. No samples were collected in 2017/2018. Severe sedimentation was observed at CM-3 during 2018/2019, which hindered sample collection until cleaned. Performance at CM-3 was also likely hindered due to the sedimentation.

Table 5 shows the number of influent samples with higher concentrations than their paired effluent samples, which shows an improvement in water quality from the influent to effluent of the CM/media filter. In the non-background CMs, the majority of sample pairs had higher influent concentrations than their paired effluent (67%, 65%, and 71% for TSS, dioxins, and lead, respectively). In addition, the number of data pairs with influent concentrations greater than the effluent concentrations were found to be statistically significant (p -value ≤ 0.05) for TSS, lead, and dioxins.

Table 5. CM-1 (“background” samples excluded), CM-9, CM-3, B-1, and Upper Lot Media Filter Combined Non-Background Statistical Analysis

	TSS (mg/L)		Dioxin (µg/L)		Lead (µg/L)	
	Influent	Effluent	Influent	Effluent	Influent	Effluent
Minimum	0.70	0.53	1.0E-12	1.0E-12	0.09	0.09
Maximum	1,800	610	3.6E-04	9.8E-07	55	39
Average	68	30	6.3E-06	6.9E-08	6.7	3.3
Median	19	13	6.8E-08	1.4E-08	3.0	1.8
Standard Deviation	215	71	4.2E-05	1.3E-07	10	5.2

Total pairs of observations	87		80		87	
Number of influent samples having larger concentrations than effluent samples	58		52		62	
Number of effluent samples having larger concentrations than influent samples	26		14		20	
Number of samples having equal influent and effluent concentrations	3		14		5	
p-value by paired nonparametric sign test ¹	<0.001 (statistically significant removal)		<0.001 (statistically significant removal)		<0.001 (statistically significant removal)	

¹ One-tail sign test used to evaluate data. P values of ≤ 0.05 are considered statistically significant.

The number of data pairs with influent concentrations greater than their paired effluent concentrations was statistically significant (p -value ≤ 0.05) for TSS, lead, and dioxins at background sites, as shown in Table 6. It should be noted that no data were collected from these sites in the most recent reporting year. In addition, as noted earlier, the influent concentrations at these sites are very low (only one of the dioxins samples at these sites, either influent or effluent, were above Permit limits), so further reductions would be difficult to achieve.

Table 6. CM-1¹, CM-8 and CM-11 Combined Background Statistical Analysis²

Number of effluent samples having larger concentrations than influent samples	6		5		3	
Number of samples having equal influent and effluent concentrations	6		10		2	
p-value by paired nonparametric sign test ³	<0.001 (statistically significant removal)		0.62 ⁴ (insufficient amount of data to show a significant difference)		0.0022 (statistically significant removal)	

¹ Only CM-1 samples that were taken from east/background tributary influent sites are included in this analysis.

² As noted earlier in this memorandum, the CM-3 performance (pre-2016/2017) cannot be reliably assessed based on the effluent sample results. For this reason, the CM-3 paired data were excluded from the statistical analysis presented in this table.

³ One-tail sign test used to evaluate data. P values of ≤ 0.05 are considered statistically significant.

⁴ Due to the high number of samples having equal influent and effluent concentrations (due to non-detects), the total pairs of observations was assumed to be 10 for purposes of calculating the p-value.

4.2 Lower Lot Biofilter Treatment Train

To date, samples were collected from the lower lot biofilter during 30 rain events that occurred after the construction was completed and fully functional, with samples collected at all three locations within the biofilter treatment train (influent, post-sedimentation basin, and post-biofilter) during 27 events from 2012/2013 through 2019/2020, two locations (influent and post-biofilter) for a single rain event in the 2013/2014 reporting year²⁹, and two locations (post-sedimentation basin and post-biofilter) for two events in 2018/2019. The post-biofilter samples collected in early 2014 represents a blend of filtered underdrain water and overflow. During one event in the 2014/2015 reporting year, unusually turbid water was observed in the biofilter; this may have been due to sediment-laden run-on from the Building 1436

Figure 56. A photo of the biofilter on 3/13/2018

²⁹ A sample was not taken at the biofilter inlet (post-sedimentation basin) during the 2013/2014 sampling year due to the sample location being submerged and inaccessible.

demolition area. Table 7, Table 8, and Table 9 summarize the paired sampling data for the biofilter.

For TSS, the majority of data pairs had higher influent concentrations than their paired effluent concentrations for all steps of the treatment train (influent runoff to the sedimentation basin outlet, the sedimentation basin outlet to the biofilter outlet, and influent to biofilter outlet), as shown in Table 7, Table 8, and Table 9, respectively.

The majority of data pairs also showed a decrease in dioxins concentration through all steps of the treatment train for all years. Across the system (influent runoff to the biofilter outlet), only one sample pair had effluent dioxins concentrations with higher concentrations than their paired influent sample.

For lead, the majority of samples from the influent runoff to the sedimentation basin outlet and across the system (influent runoff to biofilter outlet) exhibited a decrease in lead concentration, as shown in Table 6 and Table 8, respectively. However, for the sedimentation basin outlet to the biofilter outlet (Table 7), the majority of sample pairs showed higher effluent lead concentrations than their paired influent concentration.

Considering the entire system (influent runoff to the biofilter outlet), dioxin was the only COC to show a statistically significant (p -value ≤ 0.05) number of paired samples that decreased in concentration from the influent runoff to the biofilter outlet, based on the number of samples available.

4.3 ELV Treatment BMP

To date, samples have been collected from the ELV treatment BMP during 15 events from 2013/2014 through 2019/2020. Sampling was not conducted during the 2018/2019 reporting year due to a power outage at the ELV treatment BMP associated with the Woolsey fire, which destroyed the electrical infrastructure. To prevent future power outages at the ELV treatment location, a generator was added to the ELV system as the main power source, since electrical lines were not replaced in this area to reduce the risk of future fires. Samples were collected at three locations within the ELV treatment train (influent, sedimentation tank outlet, and media tank effluent) during 11 of these events. Samples were only collected at two locations (influent and effluent) during one event, the effluent location only for one event, and the effluent and mid-point location during two events.

Extenuating circumstances relevant to this site during the February/March 2014 storm event included high flows from Helipad Road to the ELV treatment system (resulting in excess inflows to the sump), inadequate erosion controls along the earthen ELV channel (resulting in excess sediment in the sump [approximately one foot of deposited sediment in the sump and less than an inch in the sedimentation tanks]), and a power outage (resulting in the sump pump not operating during part of the storm). The February/March 2014 ELV treatment BMP effluent data are still considered representative for the analysis herein, although it is recognized that because this monitoring event was the first at the ELV, washout of fines from the media bed may have been occurring.

Table 10, Table 11, and Table 12 summarize the paired data for this location. The majority of data pairs from the influent to the sedimentation tank effluent showed a decrease in TSS concentrations. However, there were more effluent samples with higher TSS concentrations than their paired influent samples from the sedimentation tank effluent to the media tank effluent and from the influent to the media tank effluent. For one of the two cases where a net increase in TSS occurred during the 2013/2014 reporting year, the ELV treatment BMP was heavily loaded by sediments eroded from the denuded ELV channel prior to implementation of recent erosion control improvements.

For each step of the treatment train, the majority of sample pairs had influent dioxin concentrations higher than their paired effluent concentrations. For lead, the majority of sample pairs showed decreasing lead concentrations from the influent to the sedimentation tank effluent and influent to the media tank effluent. However, there were more sample pairs with higher media tank effluent lead concentrations when compared to their paired sedimentation basin tank effluent concentrations.

Across the system from the influent to the media tank effluent, the number of influent samples with higher concentrations than their paired effluent samples was statistically significant ($p\text{-value} \leq 0.05$) for dioxins and lead, while TSS showed a statistically significant number of effluent samples with higher TSS concentrations than their paired influent concentrations, based on the number of samples.

Table 10. ELV Treatment BMP Performance Data – Influent to Sedimentation Tank Effluent

¹ One-tail sign test used to evaluate data. P values of ≤ 0.05 are considered statistically significant.

² The number of effluent samples with higher TSS concentrations than their paired influent samples is statistically significant (statistically significant increase in concentration from influent to media tank effluent).

4.4 Detention Bioswales

Influent and effluent sample pairs were collected from the detention bioswales for the first time during the 2015/2016 reporting year³⁰. Samples were collected at three locations representing the southern detention bioswale: two influent locations (the rock crib swale outlet and runoff from the adjacent contractor laydown area) and the effluent location. Results from the two influent locations were flow-weighted to determine a representative influent concentration. The southern detention bioswale was sampled during 25 rain events during the 2015/2016 through 2019/2020 reporting years. However, the effluent was not sampled for two of these events, the influent was not sampled for another two events, and only a single influent sample was collected for two events (so the influent sample was not flow-weighted and only represented runoff from the adjacent contractor laydown area). Therefore, a total of 21 data pairs representing the southern detention bioswale performance have been collected.

The northern detention bioswale was sampled during 18 rain events between 2014/2015 and 2016/2017. However, only the effluent location was sampled for 10 of these events, resulting in eight total sample pairs. Sampling at the northern detention bioswale was discontinued after 2016/2017.

Table 13 summarizes the paired data for this location. Performance data represents both the northern and southern detention bioswales combined. For TSS, dioxins, and lead, the majority of data pairs had influent concentrations that were higher than their paired effluent concentrations. The number of

³⁰ The effluent location for the northern detention bioswale (ILBMP0007) was sampled during the 2014/2015 reporting year. However, the influent location (ILBMP0006) was not sampled until 2015/2016.

influent samples with higher concentrations than their paired effluent samples were found to be statistically significant (p-value ≤ 0.05) for all three COCs.

The southern and northern detention bioswales were analyzed together in order to assess BMPs of a similar design. However, as shown in the paired line plots, the southern detention bioswale had a greater proportion of sample pairs that showed a decrease in concentration from the influent to effluent, for all three COCs, compared to the northern detention bioswale.

Table 13. Southern and Northern Detention Bioswale Combined Performance Data

¹ One-tail sign test used to evaluate data. P values of ≤ 0.05 are considered statistically significant.

4.5 Statistical Analysis Summary

A summary of the statistical analyses performed on the paired data presented in this section is shown in Table 14. Based on the number of sample pairs available, a statistically significant difference indicated a decrease in concentrations from the influent to effluent locations for CM/media filter sites (both excluding background sites CM-8 and CM-11 and also for CM-8 and CM-11 background sites only) and the detention bioswales, for all three COCs. The lower lot biofilter (influent runoff to biofilter outlet) showed statistically significance reductions only for dioxins (while TSS and lead were not statistically significant based on the number of sample pairs available). The ELV treatment BMP (influent to media tank effluent) showed statistically significant differences for the number of influent samples with higher concentrations than their paired effluent for lead and dioxins. However, TSS at the ELV treatment BMP showed a statistically significant difference indicating higher concentrations than their paired influent samples (showing a net increase across the system). The statistical analysis was not performed on the Boeing admin area inlet filters because only three data pairs are currently available.

Table 14. Summary of Performance Data, 2009-2020

Location	TSS		Dioxins		Lead	
	p-value ¹	Statistically significant decrease observed?	p-value ¹	Statistically significant decrease observed?	p-value ¹	Statistically significant decrease observed?
CM/media filter non-background (CM-1 [background samples excluded], CM-9, CM-3, B-1, and Upper Lot Media Filter)	<0.001	Yes	<0.001	Yes	<0.001	Yes
CM-8, CM-11, and CM-1 background	<0.001	Yes	0.62	No	0.0022	Yes
Lower Lot Biofilter (Influent Runoff to Biofilter Outlet)	0.29	No	<0.001	Yes	0.29	No ²
ELV Treatment BMP (Influent to Media Tank Effluent)	0.003	No ³	0.003	Yes	0.019	Yes
Detention Bioswales	0.0012	Yes	<0.001	Yes	0.0012	Yes

¹ One-tail sign test used to evaluate data. P values of ≤ 0.05 are considered statistically significant.

² Can likely be attributed to the much lower influent concentrations to the lower lot biofilter in recent years (to be discussed further).

³ The number of effluent samples with higher TSS concentrations than their paired influent samples is statistically significant (instead of the number of influent samples with higher concentrations than their paired effluent).

5. Influent v. Effluent Correlation Charts

Figure 57 through Figure 59 compare influent to effluent concentrations for the paired data presented above for CM/media filter sites (B-1, upper lot media filter, CM-3 [post 2017/2018], CM-9, and CM-1 non-background sites; CM-1, CM-3, CM-8, and CM-11 background sites are excluded). Correlation charts for the lower lot biofilter are shown in Figure 60 through Figure 62, Figure 63 through Figure 65 for the ELV treatment BMP, and Figure 66 through Figure 68 for the detention bioswales. The plots reflect the same data pairs used to represent the influent and effluent locations in the statistical analyses in the previous section. For example, the lower lot biofilter plots reflect influent runoff samples for the influent and sedimentation basin outlet samples for the effluent, while the detention bioswales plots show the influent location as the flow-weighted average of the rock crib swale outlet and runoff from the adjacent contractor laydown area. Similar to the paired line plots, points are shaded based on the sampling year during which they were collected, where black points represent data from the most recent 2019/2020 reporting year and data from all previous reporting years are shown as gray.

A least-squares regression was used to fit a line to log-transformed data ($\log(y) = m \cdot \log(x) + b$). The resulting equation, including the slope of the lines, m , is shown in the least-squares regression equation in the upper left corner of the graph. In addition, the p -value is also shown to indicate the significance of the reported slope term. The null hypothesis is that the slope (m) is equal to 0. If the p -value is less than 0.05, the null hypothesis is rejected, which shows that the slope is non-zero and is statistically significant at the 95% confidence level. 1 minus the significant slope term also indicates the overall percentage reduction in concentrations (when multiplied by 100x). The p -value to indicate the significance of the reported y -intercept (also represented in the least-square regression equation) is also shown. If there is a significant y -intercept, the reduction varies for different influent concentrations; if the intercept is not significant, the reduction is the same irrespective of the influent concentrations.

A 1:1 line was also added to each plot. **Data above the 1:1 line indicate an effluent increase in concentrations, while data below the 1:1 line indicate an effluent decrease in concentrations (or positive BMP performance). Additionally, the location where the 1:1 line intersects the best-fit line represents the irreducible concentration for each constituent (e.g. ~ 7 mg/L for TSS at CM sites).** Pairs where one or both results were not detected were included on these graphs with different symbols.

If the regression equations and associated ANOVA analyses indicate non-significant equation intercepts (p -value >0.05), the regressions were re-calculated with the intercept equal to zero, and this result is shown on the plots below (with the intercept p -value shown as N/A). This indicates that in general, the performance of the controls did not change by influent concentration (the percent reduction was constant). In some other cases, both the slope and intercept terms were not significant, and the regression is therefore also not significant. In this case, the effluent concentrations are not related to the influent concentrations, and the regression equation and p -values are not shown on the plots below.

6. Probability Plots

Probability plots for CM/media filter sites (B-1, upper lot media filter, CM-3 [post 2017/2018], CM-9, and CM-1 non-background sites, which excludes CM-1 background areas, CM-3, CM-8, and CM-11 (due to the substantial flows that they receive from background areas) are shown in Figure 69 through Figure 71. Probability plots for the lower lot biofilter are shown in Figure 72 through Figure 74, and plots for the ELV treatment BMP are displayed in Figure 75 through Figure 77. Probability plots for the detention bioswales are displayed in Figure 78 through Figure 80. These log-normal probability plots are prepared by ranking the available log-transformed data and calculating their probability of occurrence. These probability values (shown on the vertical axis) are plotted against their concurrent concentrations. While determining the plotting positions, non-detect (ND) data were assigned to the lowest positions, effectively truncating the probability plots at the fraction of non-detected samples. Therefore, only detected result positions are plotted, which leads to the correct probability of occurrence for the observed data, while values less than the detection limit show their unknown specific occurrences. These figures illustrate trends for influent concentrations as compared to effluent concentrations and vice versa and serve as a useful tool for predicting effluent concentrations at a given percentile.

These figures also contain some basic statistics describing the data shown on the graphs. For each influent and effluent dataset, the number of ND results is shown. The p-value resulting from an Anderson-Darling test for lognormal distributions is also shown. The Anderson-Darling test assesses if the data follows an examined distribution (p-values <0.05 indicate that the actual distribution is significantly different from log-normal distributions for these plots). The null hypothesis here is that the data comes from a lognormal distribution. If the p-value is less than 0.05, the null hypothesis is rejected, and it is concluded that the data are not lognormal distributed. The 95th percentile confidence intervals are also shown on the plots for both influent and effluent sample results. If all of the influent or effluent data points are located within the confidence interval and the p-value is greater than 0.05, one can be 95% confident that the lognormal distribution appears to fit the data fairly well, and the fitted line may be used to estimate concentrations at various percentiles.

Where influent data (blue circles) consistently fall above the effluent points (green squares), consistent water quality improvement is occurring at these areas. The vertical distance between the datasets (noting it is a log scale) also indicates the magnitude of the concentration change at these BMP types. Similar to previous plots, points are shaded based on the sampling year during which they were collected. Points that are shaded with blue or green represent data from the most recent 2019/2020 reporting year, while data from all previous reporting years are shown with blue or green outlined shapes but no fill.

The relative difference in the amount of scatter observed in these plots indicates that BMP effectiveness may vary depending on the location and constituent. These plots indicate the influent concentrations above which the BMPs are most effective (low concentrations are expected to represent concentrations unlikely to be significantly reduced by the BMP). The slope of the probability distribution also indicates the variability of the data. As an example, if the effluent slope is flatter than the influent slope, the control is reducing the variability of the effluent concentrations.

7. Multiple BMP Box Plots

Multiple BMP box plots for TSS, dioxins, and lead for all BMPs presented herein are shown in Figure 82, Figure 83, and Figure 84, respectively. These plots illustrate basic statistics of influent and effluent performance data, relative to each of the CM/media filter sites (B-1, upper lot media filter, CM-3 [post 2017/2018], CM-9, and CM-1 non-background sites), the lower lot biofilter, ELV treatment BMP, and the detention bioswales. As shown in Figure 81, the box plots reflect the median, 25th percentile, 75th percentile, 1.5 quartile values, in addition to less common values outside of the 1.5 quartiles, if applicable (shown as diamonds). These plots reflect paired data results only (the same data used in the statistical analyses, influent vs. effluent correlation charts, and probability plots). These plots are intended to illustrate the range of influent and effluent concentrations at each BMP and also show how influent and effluent concentrations compare (i.e., overall lower, higher, or equal effluent concentrations compared to the influent concentrations). If very unequal sample numbers were included in these plots, the comparison between influent and effluent concentrations would be misleading, such as if there were a much larger number of influent or effluent sample results compared to the other.

The amount of overlap of the boxes indicate visual differences in the influent and effluent concentrations. Influent and effluent datasets that are widely separated (such as dioxins at the lower lot biofilter) indicate more robust controls. Influent and effluent datasets that have substantial overlaps³¹ (such as TSS also at the lower lot biofilter) indicate similar influent and effluent concentrations. The Admin area inlet filter only has three data pairs available. Although available data are shown in the box plot for this filter, it is not possible to make conclusions on their performance until additional data become available.

For TSS, the detention bioswales was the only BMP to show no overlap between the interquartile ranges (IQR) of the influent and effluent concentrations. Although an overall decrease was noted for the CM/media filter sites and the lower lot biofilter, the differences in the box plots are still significant due to the large number of observations available. The ELV treatment BMP also shows large overlaps between the influent and effluent boxes, with an overall significant increase in TSS concentration observed.

For dioxins, the lower lot biofilter and detention bioswales did not show any overlap in the IQR of the influent and effluent boxes, with a decrease in concentrations from the influent to effluent. The CM/media filter sites and ELV treatment BMP both show an overall decrease in concentrations from the influent to effluent locations, but with more overlap in the influent and effluent boxes.

For lead, the CM/media filter sites, ELV treatment BMP, and the detention bioswales all show an overall decrease in concentration from the influent to effluent, but with overlap in the boxes for the CM/media filter sites and ELV treatment BMP, and no overlap in the IQRs for the detention bioswales. The lower lot

³¹ For small to intermediate data sets, if the median value of one set was larger than the 75th percentile value of the other set, or smaller than the 25th percentile value of the other set, it is expected that the sets are statistically different. For large datasets, less overlap between the two datasets may be present and they may still be statistically different. However, wider separation generally results in more robust performance.

biofilter showed similar concentrations of lead in the influent and effluent, as also indicated by the large overlap in the boxes.

8. Comparison to Permit Limits

The BMPs were constructed with the SSFL to reduce COCs prior to stormwater reaching Outfall 009, which is the compliance point for the NPDES permit. Permit limits do not apply to the effluent from these BMPs and they were not designed to serve that purpose. However, in this section, as a basis for evaluating effectiveness of the BMPs, we do compare the number of results greater than the Outfall 009 Permit limits for each of the influent and effluent samples at the CMs/media filters (B-1, CM-1, CM-9, upper lot media filter, and CM-3, excluding the background CMs), the lower lot biofilter, the ELV Treatment BMP, the detention bioswales, and the Boeing admin area inlet filters is shown in Table 15, Table 16, Table 17, Table 18, and Table 19, respectively. The analyses included in Table 15 through Table 19 include all data samples analyzed, not just paired samples. Because this analysis includes samples that do not have associated paired data, the number of influent sample results compared to Permit limits may be different than the number of effluent samples compared to limits. Only influent and effluent locations for the BMPs are included in this analysis; intermediate locations are not included (e.g., sedimentation basin effluent at the ELV Treatment BMP).

It should be noted that there is no limit for TSS; it is used to evaluate particulate strength or as a proxy for other constituents.

For all of the non-background CM/media filter sites analyzed, influent concentrations were more often higher than the Outfall 009 Permit limits as compared to effluent concentrations for both lead and dioxins, as shown in Table 15. The maximum and average ratios of observed concentrations to Permit limit, for results exceeding Permit limits, generally show a higher ratio for influent than effluent, for both lead and dioxins, with the exception of lead at B-1 (for the average exceedance ratio). This trend of effluent ratios lower than the influent ratios suggests lead and dioxins reductions through the CMs/media filters. These results enhance the weight of evidence that the BMPs are performing effectively and reducing concentrations, especially when not enough samples are available for all of the statistical tests.

It should be noted that dioxin results for B-1 are skewed by one exceptionally high influent result of 3.6×10^{-4} $\mu\text{g/L}$ on 12/2/2014. If that result is removed, then the maximum influent ratio drops to 94 and the average becomes 17. CM-1 is skewed by one dioxin effluent result of 4.3×10^{-6} $\mu\text{g/L}$ on 3/17/2012, where the maximum effluent ratio decreases to 35 and the average drops to 7.5 if that result is removed.

Table 15. Influent and Effluent Summary as compared to the Outfall 009 Permit Limits (B-1, CM-1, CM-9, Upper Lot Media Filter, CM-3 [post 2017/2018]), 2009-2020

BMP	Parameter	% of Samples Greater than Permit Limits		Maximum Exceedance Ratio (Exceeding Result : Permit Limit)		Average Exceedance Ratio (Exceeding Result : Permit Limit)	
		Influent	Effluent	Influent	Effluent	Influent	Effluent
B-1	Lead	35%	8.7%	1.8	1.7	1.3	1.5
	TCDD TEQ no DNQ	85%	68%	12,868	10	773	3.9
CM-1	Lead	37%	18%	11	7.5	3.9	3.1
	TCDD TEQ no DNQ	76%	58%	3,149	155	159	15
CM-9	Lead	41%	24%	11	6.9	4.2	2.9
	TCDD TEQ no DNQ	49%	22%	56	5.2	8.5	3.2
Upper Lot Media Filter	Lead	13%	0%	1.2	N/A ¹	1.1	N/A ¹
	TCDD TEQ no DNQ	75%	44%	11	2.7	4.8	1.7
CM-3	Lead	40%	0%	1.7	N/A ¹	1.5	N/A ¹
	TCDD TEQ no DNQ	0%	0%	N/A ¹	N/A ¹	N/A ¹	N/A ¹

¹Not calculated because there were no exceedances of Permit limits

The number of results exceeding the Permit limits for the influent and effluent samples at the lower lot biofilter are summarized in Table 16. Influent concentrations were more often higher than the Outfall 009 Permit limits as compared to effluent concentrations for lead (three influent vs. one effluent, out of 28 and 30 samples, respectively) and dioxins (25 influent vs. three effluent, out of 28 and 30 samples, respectively). Observation of the maximum and average ratios of observed concentrations to the Permit limit show that a higher ratio is calculated for influent than effluent samples for lead and dioxins, suggesting reduction in both pollutants through the lower lot biofilter. One exceedance may have been due to a power outage resulting in manual pumping from the cistern to the sediment basin, which could have overloaded the biofilter. A portable generator is now on hand for the biofilter cistern pump as a backup power supply.

Table 16. Influent and Effluent Summary as Compared to the Outfall 009 Permit Limits (Lower Lot Biofilter), 2013-2020

Parameter	% of Samples Greater than Permit Limits		Maximum Exceedance Ratio (Exceeding Result : Permit Limit)		Average Exceedance Ratio (Exceeding Result : Permit Limit)	
	Influent	Effluent	Influent	Effluent	Influent	Effluent
Lead	11%	3.3%	3.8	1.1	2.1	1.1
TCDD TEQ no DNQ	89%	10%	17	5.2	4.0	3.3

Similar trends are observed for the ELV treatment BMP, as shown in Table 17. There were a greater number of influent sample concentrations exceeding the Outfall 009 Permit limits compared to effluent concentrations for lead and dioxins. Only two influent concentrations (out of 12 samples) of lead exceeded the Permit limit (no effluent samples exceeded), while there were four influent concentrations (out of 12 samples) of dioxins that exceeded the Permit limit and only two effluent concentrations (out of 15 samples) that exceeded the permit limit for dioxins. As observed with the CM sites and lower lot

biofilter, higher maximum and average ratios of observed concentrations to Permit limits were calculated for influent samples compared to effluent samples. This trend also suggests reduction in lead and dioxins through the ELV treatment BMP.

Table 17. Influent and Effluent Summary as compared to the Outfall 009 Permit Limits (ELV Treatment BMP), 2013-2020

Parameter	% of Samples Greater than Permit Limits		Maximum Exceedance Ratio (Exceeding Result : Permit Limit)		Average Exceedance Ratio (Exceeding Result : Permit Limit)	
	Influent	Effluent	Influent	Effluent	Influent	Effluent
Lead	17%	0%	9.7	N/A ¹	5.9	N/A ¹
TCDD TEQ no DNQ	33%	13%	13	6.9	4.8	4.2

¹Not calculated because there were no exceedances of Permit limits

The number of results exceeding the Permit limits for the influent and effluent samples at the detention bioswales are shown in Table 18. Influent concentrations were more often higher than the Outfall 009 Permit limits as compared to effluent concentrations for both lead and dioxins. 11 influent concentrations (out of 31 samples) of lead exceeded the Permit limit, while no effluent concentrations (out of 41 samples) exceeded the Permit limit for lead. 23 influent concentrations (out of 31 samples) of dioxins exceeded the Permit limit, and six effluent concentrations (out of 41 samples) exceeded the Permit limit for dioxins. The maximum and average influent exceedance ratios for dioxins are greater than the effluent ratios, suggesting that dioxins are generally reduced through the detention bioswales.

Table 18. Influent and Effluent Summary as compared to the Outfall 009 Permit Limits (Detention Bioswales), 2015-2020

Parameter	% of Samples Greater than Permit Limits		Maximum Exceedance Ratio (Exceeding Result : Permit Limit)		Average Exceedance Ratio (Exceeding Result : Permit Limit)	
	Influent	Effluent	Influent	Effluent	Influent	Effluent
Lead	35%	0%	4.5	N/A ¹	1.8	N/A ¹
TCDD TEQ no DNQ	74%	15%	737	6.7	56	3.4

¹Not calculated because there were no exceedances of Permit limits

The number of results exceeding the Permit limits for the influent and effluent samples at the Boeing admin area inlet filters are summarized in Table 19. Only three data pairs (influent and effluent samples) are available. For lead, all of the influent and effluent sample results were below the Outfall 009 Permit limits. For dioxins, all of the influent and effluent sample were above the Permit limit. The maximum and average ratio of observed concentrations to the Permit limit for dioxins show a higher ratio for effluent than influent samples, suggesting an increase in concentration through the inlet filter for the one data pair. Again, the few data available at this location prevents any statistical evaluations.

Table 19. Influent and Effluent Summary as compared to the Outfall 009 Permit Limits (Boeing Admin Area Inlet Filters) 2018-2020

Parameter	% of Samples Greater than Permit Limits		Maximum Exceedance Ratio (Exceeding Result : Permit Limit)		Average Exceedance Ratio (Exceeding Result : Permit Limit)	
	Influent	Effluent	Influent	Effluent	Influent	Effluent
Lead	0%	0%	N/A ¹	N/A ¹	N/A ¹	N/A ¹
TCDD TEQ no DNQ	100%	100%	9.0	76	6.5	31

¹Not calculated because there were no exceedances of Permit limits

9. Runoff Volume Discharge Analysis

In addition to water quality performance, the lower lot biofilter is also designed to reduce the frequency of smaller storms discharging untreated runoff to the Northern Drainage and thereby discharging via Outfall 009 by retaining the storm runoff and allowing evapotranspiration to take place. It was estimated in 2017 that the average volume pumped to the biofilter has increased from 52,000 gallons per inch of rainfall to 82,000 gallons per inch of rainfall since the detention bioswales were constructed. Similarly, the estimated percent of total runoff volume (from both the 24-inch drain and the lower lot drainage areas) increased from 22% to 44% on average since the detention bioswales were constructed.

To evaluate how many storms have been prevented from discharging to the Northern Drainage this year, a binned presence/absence of discharge plot was developed as shown in Figure 85. All storms sampled since the lower lot biofilter was constructed are included (3/8/2013 to present). The storm events with discharge to the Northern Drainage (i.e., bypass of the low flow diversion weir or treated effluent from the biofilter) were identified and counted. The total number of storm events compared to the number of events where discharge occurred were then binned based on storm depth in one-inch increments. Additionally, this plot shows the percent of discharging events (i.e., number of events with discharge divided by the number of total events for that storm depth bin). As is shown in Figure 85, **the lower lot biofilter successfully prevented just over half of all storms less than or equal to one inch from discharging to the Northern Drainage**, but had decreasing effects for larger rains, with no expected benefits for storms greater than 2 inches.

Figure 85. Binned Presence/Absence of Discharge at the SSFL Lower Lot Biofilter

10. Sampling Event Analysis

The Expert Panel evaluated the need for additional sampling at the BMPs in the context of the recent slow-down in site activities particularly in the Outfall 009 watershed. Following the 2016/2017 reporting year, it was decided that until site activities increase, samples would only be collected twice per year at the following BMPs: upper lot media filter, southern detention bioswale, lower lot biofilter, CM-1 (influent-west and effluent), Boeing admin area inlet filters, and the ELV Treatment BMP. The CM-1 influent-east (background) location will continue to be sampled during every storm, in order to collect more background data and because it was recently reconstructed with new media and the upstream ponding volume was increased. No further changes are proposed at this time.

11. Cumulative TSS Loading Analysis

An analysis was performed to calculate the cumulative TSS loading to each BMP thus far, based on historical storm event depths and the measured influent concentrations of TSS. These values were compared to the estimated sediment load that would result in highly reduced flows through the media which would cause larger volumes of bypassed flows, based on the lab column media performance study by Pitt and Clark (2010).

The estimated TSS loading to each BMP containing media and with sufficient data (ELV Treatment BMP, lower lot biofilter, B-1 media filter, CM-1, CM-9, and the upper lot media filter) was estimated for each storm event where a sample was collected (at either the influent or effluent location³²). Sampling was reduced at the lower lot biofilter, the ELV Treatment BMP, upper lot media filter, and CM-9 following the 2017/2018 reporting year. Therefore, TSS concentrations were estimated at these BMPs³³. The same methodology was followed for the B-1 media filter, where sample ceased following the 2015/2016 reporting year. The estimated cumulative TSS loading was determined using the following steps:

- The average annual percent capture and treatment (i.e., the percentage of incoming runoff that does not bypass the BMP) was determined using USEPA's Storm Water Management Model (SWMM) for each BMP.
- The runoff coefficient for each BMP's drainage area was determined using SWMM, simulated over the average annual year scenario.
- The total area of each BMP's drainage area was determined using available Geographic Information System (GIS) shapefiles.
- The runoff volume treated by each BMP during each individual storm event was calculated as follows:
 - Storm event volume treated = BMP drainage area x Storm event rainfall depth x Runoff coefficient of the BMP drainage area x Average annual percent capture
- The storm event TSS loading contributed to each BMP during each individual storm event was then calculated as follows:

³² In the event that an effluent sample was collected and an influent sample was **not** collected during the same storm event, the TSS influent concentration was estimated (to be discussed) to represent the influent loading of TSS during this specific event.

³³ Characteristics from storm events that previously resulted in discharge at each BMP were used to predict if the BMPs discharged during storm events (where samples were not collected, due to reduced sampling activities). If the storm event total depth, average intensity, or maximum intensity of an unsampled storm event exceeded the 10th percentile total depth, average intensity, or maximum intensity, respectively, of sampled historical storm events, that storm was considered to have resulted in BMP discharge and TSS loading was retroactively estimated. If TSS loadings were estimated for storm events that were not sampled for a given BMP, the average of all TSS influent samples from the three rainy seasons preceding and following at that BMP was used to represent the influent loading of TSS during this specific event.

- Storm event TSS loading = Storm event volume treated x Event-dependent TSS influent sample result (concentration)
- The cumulative TSS loading since implementation of the BMP was calculated by summing the storm event TSS loading results from all storms occurring since the BMP was constructed.
- The media area of each BMP was estimated from plans³⁴, and the cumulative TSS loading per unit area of media was calculated for each BMP.

For BMPs with pretreatment (ELV Treatment BMP and lower lot biofilter), the “influent” sample used was the sample collected at the effluent of the sedimentation basin or the influent to the media. The cumulative TSS loading per media unit area to each BMP was compared to the estimated sediment load to the media until initial maintenance is needed (about 50 kg/m²) (Pitt and Clark, 2010). The percentage of cumulative sediment loading until highly reduced treatment flows for each BMP is shown in Table 20.

The estimated number of years until media replacement is needed was calculated for each BMP, assuming an average rainfall amount during the reporting year for all subsequent years, and is also shown in Table 20. This was estimated using a similar procedure outlined above based on an average rainfall year. The long-term average annual rainfall of 17.0 inches was used as the storm event depth and the average TSS concentration from all sampled events was used as the TSS influent sample result. The estimated TSS loading to each BMP (per media area) during an average rainfall year and the number of average years until media replacement is needed is shown in Table 20. It should be noted that varying annual rainfall, in addition to smaller or larger storm events, will result in varying TSS loading and this serves as a rough estimate of when replacement may be expected.

Additional analyses and standing water depth and flow bypass observations were made during the 2016/2017, 2017/2018, 2018/2019, and 2019/2020 reporting years related to BMP clogging and maintenance.

An analysis of flow monitoring data obtained in 2017 show that CM-9 and CM-1 began with an estimated range of hydraulic conductivities that is close to or exceeds the “average flow rate before initial clogging” of 33 inches per hour from the Media Report (Pitt and Clark, 2010). Over time, these conductivities will be substantially reduced to well below this value suggesting that maintenance may be needed to remove sediment deposited over the rainy season. Since the media mounds of the CMs are covered with backfill and gravel, it is possible that these surface materials are clogged with sediment and the actual media itself may not be the limiting factor. Therefore, the 2017 analysis shows that media may actually be clogged more than results in Table 20 indicate. Conclusions of this analysis resulted in recommendations to either replace the media or design and construct a new engineered treatment system to better handle larger fractions of the annual flows. This was done at CM-1 in 2018. Since CM-1 was reconstructed and the media was replaced in August 2018, the analysis shown in Table 20 starts in 2018/2019 for CM-1.

³⁴ For CM-1 and CM-9, it was assumed that the front half of the media mound received flow, especially during small storm events. However, ponding can occur above the media filter, especially during large storm events, and infiltrate over a larger surface area. Therefore, the media area estimate is conservative for CM-1 and CM-9.

Maintenance observations of the BMPs performed during the 2018/2019 reporting year showed that ponding occurred during several storm events (a few inches deep in front of the weir boards) at CM-9. There were no observations of ponding during this 2019/2020 reporting year. However, due to the observed ponding at CM-9 during the 2018/2019 reporting year and estimated sediment loading until maintenance is needed, **it is recommended to replace the media at CM-9.**

This analysis did not evaluate the other CMs this year. However, based on a comparison of their pervious drainage areas compared to CM-1 and CM-9, it is estimated that **CM-3 may need maintenance soon** (potentially after the next rainy season), but CM-8 and CM-11 will not require maintenance in the near future.

Table 20. Percent of Cumulative Sediment Loading until Clogging

BMP	Wet Seasons in Operation	Cumulative TSS load (kg)	Cumulative TSS load per media area (kg/m ²)	% of "sediment load to the media until maintenance is needed"	TSS load per media area in average rainfall year (kg/m ²)	Number of average years until media replacement is expected
ELV Treatment BMP	7	90	4.5	9.2%	1.5	30
Lower Lot Biofilter	7	925	4.2	8.6%	1.2	36
B-1	9	458	24	49%	4.7	5
Upper Lot Media Filter	4	163	6.4	13%	1.6	27
CM-1 ¹	2	80	13	27%	6.2	6
CM-9	11	240	40	82%	6.4	1

¹Restarted in 2018/2019 after BMP reconstruction and media replacement. Prior to reconstruction (which occurred prior to the 2018/2019 rainy season, in August 2018), CM-1 was estimated to have approximately 400 kg of cumulative TSS loading (which represents approximately 136% of the estimated sediment load until maintenance is needed). CM-1 had been in operation nine rainy seasons before reconstruction occurred. As shown in the table, CM-1 is anticipated to need maintenance again in five years, which would result in a lifespan of seven years.

12. Discussion and Observations

The following general observations were made based on an evaluation of the aforementioned data summary charts and tables.

1. Are the CMs/media filters reducing the concentrations of lead, dioxin, and TSS between the untreated influent and the treated effluent?

Yes. The CMs were originally installed as provisional (pending further evaluation) stormwater controls that could be installed in areas where existing culverts carried the stormwater below the roads. As a result, they handle a wide range of flows during a typical rain year and experience relatively short treatment residence times and the weirs overflow during average to large size storms. However, the performance monitoring results indicate that statistically significant pollutant concentration reductions are occurring for TSS, dioxins, and lead at the non-background CMs/media filters (i.e., CM-1, CM-9, B-1, and upper lot media filter) as a result of their sedimentation and media treatment unit processes. Effluent concentrations of TSS, dioxins, and lead were also lower than corresponding influent samples for the CM background locations (i.e., CM-8 and CM-11), with statistically significant pollutant removal observed for all three COCs. Monitoring results show that the CMs are reducing the concentrations of TSS, dioxins, and lead between the influent and effluent at both the non-background and background CMs.

2. Are the detention bioswales, Lower Lot Biofilter, and ELV Treatment BMPs reducing the concentrations of lead, dioxin, and TSS between the untreated influent and the treated effluent?

Generally. Cumulative performance monitoring data (as summarized by the statistical analysis tables, correlation charts, and probability plots) indicate that detention bioswales effluent concentrations were lower than corresponding influent samples for all COCs evaluated. Statistically significant pollutant removals were observed for all three COCs. Effluent concentrations were generally lower (compared to influent runoff) at the lower lot biofilter for dioxins, with statistically significant pollutant removal observed. In contrast, for lead and TSS, there were only slightly more data pairs with higher effluent results compared to data pairs with higher influent results for the biofilter (see additional discussion on question #4 of this section).

Data from the ELV Treatment BMP showed that the majority of sample pairs had lower effluent concentrations for dioxins and lead than corresponding influent samples, with statistical significance shown for both dioxins and lead. However, the majority of data pairs had higher effluent TSS concentrations than influent concentrations (with statistical significance).

In addition, the number of results exceeding the Permit limits for both the influent and effluent samples show an improvement in water quality between the untreated influent and the treated effluent, as described in the subsequent observation below.

3. Are the treatment controls aiding in compliance with NPDES permit limits at Outfall 009?

Yes. Collectively, the treatment controls have resulted in water quality improvement and NPDES compliance at Outfall 009, where lead and dioxin compliance challenges persist. All COC-BMP

combinations had fewer effluent concentration results above Permit limits compared to the influent concentrations (with the exception of the Boeing admin area inlet filters, which only had three influent and effluent data pairs available, and all influent and effluent results exceeded permit limits). It is important to note that the discharge from the inlet filters flows to the lower lot biofilter for subsequent treatment. Most COC-BMP combinations also showed lower average and maximum exceedance ratios (i.e., exceeding sample concentrations divided by the Permit limit) for effluent results compared to the influent results³⁵. These observations show that the treatment controls are improving storm water quality prior to reaching Outfall 009. For example, average influent exceedance ratios for CM-9 were 4.2 and 8.5 for lead and dioxins, respectively, while the average effluent exceedance ratios were reduced to 2.9 and 3.2 for lead and dioxins, respectively, during this same time period. This not only demonstrates that the treatment controls are reducing NPDES COC concentrations in stormwater upstream of Outfall 009, but that the treatment control drainage areas (which include paved roads) are pollutant generating source areas that, without treatment, would have worsened water quality at the downstream NPDES compliance location.

4. Is there a reason why some recent monitoring data at the lower lot biofilter have shown net increases in pollutant concentrations across the system compared to prior years?

Yes. As previously noted, dioxin reductions across the system have been consistent, as 27 out of 28 sample pairs decreased in dioxin concentrations from the influent runoff to the biofilter outlet. However, 16 of the 28 paired samples had higher influent concentrations than their paired effluent concentrations for TSS, and 14 of the 28 samples had larger influent concentrations for lead. It should first be noted that there are no applicable permit limits for TSS for Outfall 009, only one effluent sample has exceeded permit limits for lead (sample collected on 12/2/2014), and three effluent samples have exceeded permit limits for dioxins. However, this pattern of net increases in lead concentrations (and in part, TSS concentrations) across the system can likely be attributed to the significantly lower influent concentrations to the lower lot biofilter in recent years. The B1436 detention bioswales, which were constructed in December 2014, slow and treat a portion of the drainage area which would have previously flowed to the lower lot biofilter. Significant pretreatment is being achieved by the detention bioswales, even though their primary purpose is to delay the influent runoff to the lower lot biofilter and reduce the portion of the total flow that bypasses the BMP during large storm events. As previously noted, the average volume pumped to the biofilter has increased since the detention bioswales were constructed. Similarly, the estimated percent of total runoff volume (from both the 24-inch drain and the lower lot drainage areas) has increased since the detention bioswales were constructed. The average influent TSS concentration to the Lower Lot biofilter for samples collected before or during December 2014 was 109 mg/L, and the average for samples collected after December 2014 was 19 mg/L. This trend of significantly lower TSS influent concentrations following construction of the detention bioswales was also observed for lead, where the average influent lead concentration before and after construction of the detention bioswales

³⁵ The only exceptions include the average exceedance ratio for lead at B-1 and dioxins for the Boeing Admin Area inlet filters (both average and maximum exceedance ratio).

was 8.0 µg/L and 2.0 µg/L, respectively. The average effluent concentrations of both TSS and lead were lower in post-detention bioswale samples when compared to pre-detention bioswale samples (i.e., 41 mg/L vs. 18 mg/L for TSS and 4.0 µg/L vs. 1.9 µg/L for lead). The number of sample pairs with higher effluent concentrations than their paired influent concentrations for TSS and lead can be explained by the significant reduction in average influent concentrations to the Lower Lot biofilter since construction of the detention bioswales. It is usually not possible to reduce low TSS influent concentrations compared to high TSS influent concentrations, especially with pre-treatment that has already removed the larger particles, leaving only small particles that are difficult to remove due to sedimentation and filtering in the media. Additionally, scour or leaching of previous captured material may also be contributing to this observation.

5. Is the lower lot biofilter preventing stormwater runoff from discharging to the Northern Drainage?

Yes. Monitoring data at the lower lot biofilter were examined to determine its ability to prevent smaller storms from discharging to the Northern Drainage. The lower lot biofilter successfully prevented just over half of all storms less than or equal to one inch originating in the lower lot tributary area from discharging to the Northern Drainage, which flows to Outfall 009.

6. Has an adequate number of samples been collected such that sampling can be potentially discontinued at some locations?

Yes. Following the 2016/2017 reporting year, the Expert Panel evaluated the need for continued sampling at the BMPs. It was decided that in the context of reduced site activities (e.g., reduced construction, demolition, etc.) anticipated for the 2017/2018 reporting year in the Outfall 009 watershed, samples would only be collected twice per year at the following BMPs: upper lot media filter, southern detention bioswale, lower lot biofilter, CM-1 (influent-west and effluent), and the ELV Treatment BMP. Two background locations are planned to continue to be sampled during every storm, in order to collect more background data. The Panel has committed to revisiting the monitoring frequency when Outfall 009 watershed site activities increase.

7. Is significant maintenance required for any of the BMPs?

Yes. Replacement of media at CM-9 is recommended soon, due to the observed ponding during the 2018/2019 reporting year and estimated sediment loading until maintenance is needed. Recent data have shown evidence of solids export through the underdrain of the ELV treatment BMP, based on the dioxins particulate strength decreasing through the media layer. The the ELV treatment BMP will be further investigated to better understand the recent performance and adding a bridging layer to keep media in place may be considered. The cumulative TSS loadings to the ELV Treatment BMP, lower lot biofilter, B-1 media filter, upper lot media filter, CM-1, and CM-9 were investigated and compared to the estimated value of cumulative sediment loading to the media before maintenance is needed (Pitt and Clark, 2010). The ELV Treatment BMP, lower lot biofilter, and upper lot media filter were only 9.2%, 8.6%, and 13%, respectively, towards requiring maintenance, and it was estimated that maintenance would not be needed for approximately 30 years, assuming average rainfall years. This long maintenance interval is due to significant pretreatment of the stormwater before the media treatment at those locations. However, calculations showed that CM-1 reached the cumulative sediment loading

where maintenance was needed (136%) during the 2017/2018 reporting year based on lab measurements of cumulative solids loading until media clogging. Some bypass/overflow potentially associated with media clogging at CM-1 was also observed during the 2016/2017 reporting year. Due to the estimated sediment loading and ponding observations, CM-1 was reconstructed, and the media replaced in August 2018. Cumulative solids loadings at B-1 and CM-9 were estimated to be 49% and 82% respectively, towards lab-based thresholds of media clogging, and initial maintenance is expected to be needed in approximately five and one years, respectively, assuming average rainfall years. Ponding was observed at CM-9 during several storm events during the 2018/2019 reporting year. However, ponding was not observed (at any of the CMs) during the 2019/2020 reporting year, after 72 hours following storm events. It should be noted that each BMP was observed (72 hours post storm event) during three storm events during 2019/2020. The Expert Panel recommends that observations of clogging, overflow, and underdrain flows should continue to be taken at BMPs -- stage recorders may also be used -- during storms when performance samples are collected (to confirm that underdrains are functioning properly and bypass through weir boards is not occurring) as well as following storms (to confirm that extended ponding is not occurring) so that this consideration is tracked and timely maintenance can be performed when needed.

8. Is pollutant removal performance deteriorating at any BMPs?

No. Based on long-term monitoring results of all BMPs, effluent concentrations tracked the influent concentrations, with no significant differences with time. Changes in influent concentrations due to altered site conditions had the strongest impact on effluent trends, however all effluent concentrations remained low. Based on these observations, it is not likely that chemical breakthrough occurred at any of the media treatment systems at SSFL.

1. Introduction

In the 2018/19 Santa Susana Field Laboratory (SSFL) Site-Wide Stormwater Annual Report, the Surface Water Expert Panel (SWEP) recommended new subarea monitoring in the Outfall 001 and 002 watersheds to determine the extent to which areas near potentially impacted soils, natural background areas, and areas with pavement may contribute to exceedances at the outfalls and where and how to control these sources. Table 1 describes each subarea and the number of samples collected this year. This appendix includes stormwater monitoring results at the subarea monitoring locations compared to the Outfall concentrations for constituents that exceeded Benchmarks at Outfalls in 2019/20. In the 2019/20 season (the first rain season for sampling at these locations), four of the six identified subareas had sampleable flows and these are indicated by the blue drainage areas shown in Figure 1. The two gray drainage areas were observed for flows but did not produce any sampleable flows during the rains.

Table 1. Subarea Descriptions

Outfall Watershed	Subarea	Description	Number of Samples Collected
001	EPSW001IE01	Potentially impacted soils near Area 1 Burn Pits	2
	EPSW001BG01	Background soils with potential impact from gravel road	1
	EPSW001PV01	Background soils with potential impact from paved road	0
002	EPSW002IE01	Potentially impacted soils near STL-IV	0
	EPSW002IE02	Potentially impacted soils near Coca	3
	EPSW002BG01	Background soils with potential impact from gravel/dirt road	1

According to the 2019/20 sampling plan (Appendix A), the filtered and total concentrations of each constituent were analyzed for each stormwater sample. Particulate strength (PS) is the constituent concentration associated with particulate matter in stormwater and is a means to normalize stormwater constituent concentrations by TSS. Normalizing constituent concentrations by TSS is helpful for comparing solid concentrations of hypothesized sources between sample locations. This tool is useful for the constituents that are highly associated with particulates and are not found in significant quantities in filtered (dissolved) forms. PS is calculated by the following equation and applying the appropriate unit conversions.

$$PS = \frac{(\text{total concentration} - \text{filtered concentration})}{\text{total suspended solids concentration}}$$

The 2019/20 monitoring results from these subareas are organized by constituent shown below, including a summary of the results and a comparison to their respective outfall concentrations and particulate strengths.

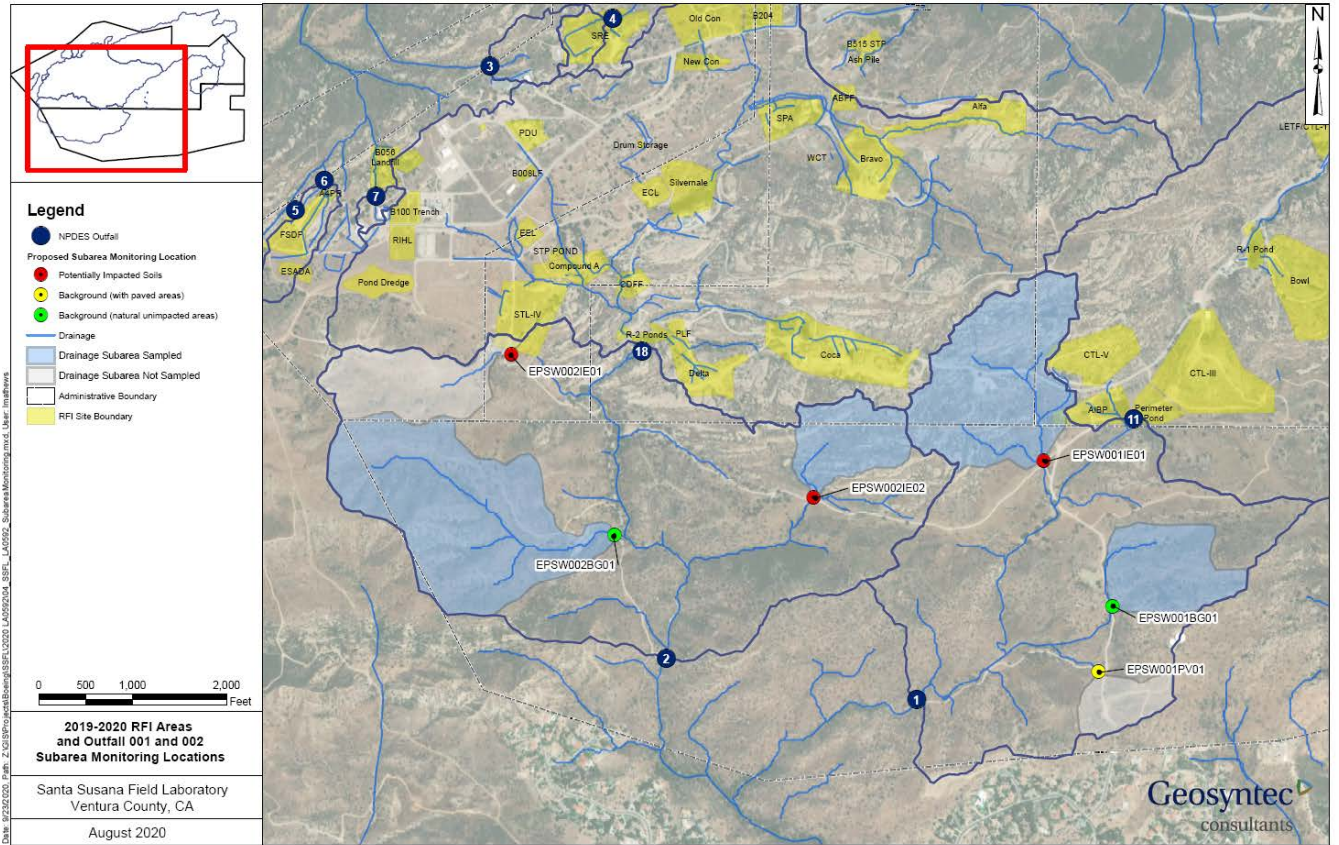

Figure 1. Subarea monitoring locations in the Outfall 001 and 002 watersheds.

Total suspended solids (TSS) does not have a NPDES Benchmark or Effluent Limit defined in the SSFL 2015 NPDES Permit; however, it can be used to recognize areas of excessive soil erosion and to analyze particulate-bound pollutants by the method of particulate strengths. As shown in Figure 2, the TSS concentrations vary depending on their location within the larger outfall watersheds, with some locations exhibiting higher erosion than others. The Outfall 001 Background Subarea (EPSW001BG01) and Outfall 002 Potentially Impacted Subarea (EPSW002IE02) had the highest TSS concentrations of the subarea samples. Areas with higher TSS concentrations will be evaluated for erosion control BMPs as needed.

Figure 2. TSS concentrations at subarea monitoring locations, Outfall 001, and Outfall 002

2. Exceeding Constituent Results

Results for constituents that were reported to have exceeded Benchmarks at Outfalls in 2019/20 (iron, lead, manganese, gross alpha¹, and TCDD TEQ (no DNQ)) are shown in Figures 3-15. The concentrations varied between subareas and sampling events, however, the Outfall 001 Background Subarea (EPSW001BG01) consistently had the highest total concentrations. Gross Alpha activity was only detected in two of the subarea samples and in two Outfall 002 samples. TCDD TEQ (no DNQ) was detected in approximately half of the subarea samples. The pattern of filtered iron and manganese concentrations roughly follows the spatial trends of the total metals measured. Filtered lead was only detected in one subarea sample, at the potentially impacted soils area within Outfall 002 watershed (EPSW002IE02). The total concentration of each exceeding constituents generally followed TSS trends indicating soil erosion may be responsible for the elevated concentrations observed at these locations.

¹ Quarterly Monitoring Report reported one exceedance for gross alpha (14.1 +/- 3.6 pCi/L), but noted this result was indeterminate compared to the daily max benchmark (15 pCi/L) and that Outfall 001 annual average (3.65 +/- 0.64 pCi/L) was below, therefore concluding gross alpha at Outfall 001 was in compliance for the reporting year.

The calculated particulate strengths for iron, lead, and manganese were comparable to the range of soil concentrations found in natural background soils at approximately 10,000-100,000 mg/kg, 5-150 mg/kg, and 200-1,000 mg/kg, respectively (see Appendix C for more details). This consistent range of particulate strengths in combination with the TSS trends indicate soil erosion is the likely source of iron, lead, and manganese measured in stormwater at Outfall 001 and 002.

The calculated gross alpha particulate strengths across all detected samples were consistent at just under 100 pCi/g. Similarly, most of the detected TCDD TEQ (no DNQ) samples had a particulate strength between 10^{-7} - 10^{-6} mg/kg. This indicates these locations likely shared the same diffuse, site-wide source in stormwater. The consistent range of particulate strengths for detected samples, in combination with the TSS trends, indicate soil erosion is the likely responsible for the elevated concentrations observed at these subareas.

All conclusions herein are based on this preliminary dataset from 2019/20. Since subarea monitoring in Outfall 001 and 002 watersheds was only started this year, it is recommended that monitoring continues so that additional samples can enable a more robust analysis.

1. Introduction

Long-term trends and seasonal trends of 2019/20 exceeding constituents were evaluated to determine if the water quality at the site is changing over time and how this last year compares to previous years. Table 1 below summarizes annual rainfall and number of stormwater discharges at the site with outfalls that discharged in 2019/20 shaded in gray. Comparing the discharges in 2019/20 to 2018/19 and 2016/17, recent years with above average rainfall, reveals that the number of discharges at Outfalls 001, 008, 009, and 018 are more similar to 2016/17. Outfall 002 on the other hand had more discharges and was more similar to 2018/19 in the number of discharges. A lognormal regression model was determined using all detected results at Outfalls 001, 002, 008, 009, and 018 together, since these were the outfalls that discharged in 2019/20. The 2018/19 results were excluded from the long-term trend calculation since these were the post-wildfire conditions and not expected to be consistent with a long-term trend. An analysis of variance (ANOVA) test was conducted to determine if the trend was statistically significant ($p < 0.05$). Note 3 in each figure highlights if the trend was statistically significant or not. Figures 1-36 show the timeseries plots for the long-term (2013-2020) and intraseasonal trends (single seasons from 2015-2020).

Table 1. Historical Rainfall and Discharges at SSFL

Reporting Year	Annual Rainfall* (inches)	Number of Rain Events	Number of Outfall Discharges								
			001	002	004	006	008	009	010	011	018
2019/20	20.5	9	3	9			5	5			4

2013/14	6.1	5						1	1		
2012/13	8.1	9						3			

* Above average annual rainfall amounts are **bolded** (17.02 inches).

Total suspended solids (TSS) does not have a benchmark or limit defined, however, it is useful in order to interpret other constituent concentrations. There is a statistically significant trend that indicates site-wide TSS concentrations are decreasing. This is likely due to Best Management Practices (BMPs) that have been added each year. Some BMPs, such as wattles and rip-rap, are added to stabilize areas susceptible to erosion, while others are added to treat stormwater (i.e. filter media BMPs). On the other hand, there is no statistically significant long-trend for any of the exceeding constituents.

Intraseasonal trends were analyzed in the same way. In the three years leading up to the Woolsey Fire (2015/16, 2016/17, and 2017/18), there were no significant trends within the course of a single rainy season. However, in the months following the fire, during the 2018/19 rainy season, there was a statistically significant decreasing trend in concentrations for TSS, gross alpha, iron, lead, and manganese. This indicates the concentrations of these constituents were influenced by post-fire conditions. In 2019/20, only TSS still had a statistically significant decreasing trend, albeit with a smaller slope than immediately following the wildfire. Taken all together, these temporal trends indicate the site has mostly recovered from the wildfire as none of the exceeding constituents exhibited the decreasing trend that was observed in the season immediately after the fire.

1. Introduction

In order to answer a frequent question of how Santa Susana Field Lab (SSFL) stormwater quality compares to surrounding creeks and rivers, wet weather surface water quality monitoring results from regional monitoring programs were compiled. Constituents that have exceeded SSFL NPDES limits and benchmarks in the past two years were included. Publicly available data were mined from the California Environmental Data Exchange Network (CEDEN) and the Regional Water Quality Control Board that are reported for various surface water monitoring programs. Figure 1 shows the locations of the regional stormwater sampling locations that were used in this comparison. The Calleguas Creek, Los Angeles River, and Malibu Creek watersheds were selected based on their proximity to SSFL. SSFL Outfalls 001, 002, 008, 011, and 018 discharge into the Los Angeles River Watershed, while the rest of the site's outfalls discharge into the Calleguas Creek Watershed. As shown in Figure 1, the Los Angeles River Watershed is the most urbanized of these three. Malibu Creek Watershed has a mix of urban and open space, while the Calleguas Creek Watershed has more significant amounts of agriculture mixed in with urban areas. There were no regional stormwater results for gross alpha or dioxins (TCDD TEQ (no DNQ)), so for these parameters all available statewide results from CEDEN were used. All monitoring locations are shown in Figure 2.

The following boxplots reflect 2001 - 2020 wet weather sample results from the Calleguas Creek Watershed, 2006 - 2018 wet weather results from the Los Angeles River Watershed, and 2006 - 2019 wet weather results from the Malibu Creek Watershed (Figures 3-16). These data were compared to SSFL stormwater data from reporting year 2013/14 through reporting year 2019/20. Dry weather sampling results¹ were excluded from the offsite data presented here, to focus the comparison on wet weather (stormwater) conditions only, whereas dry weather samples can reflect other non-stormwater sources (e.g., POTW effluent, groundwater, and other NPDES discharges). SSFL data similarly reflect stormwater-only flows.

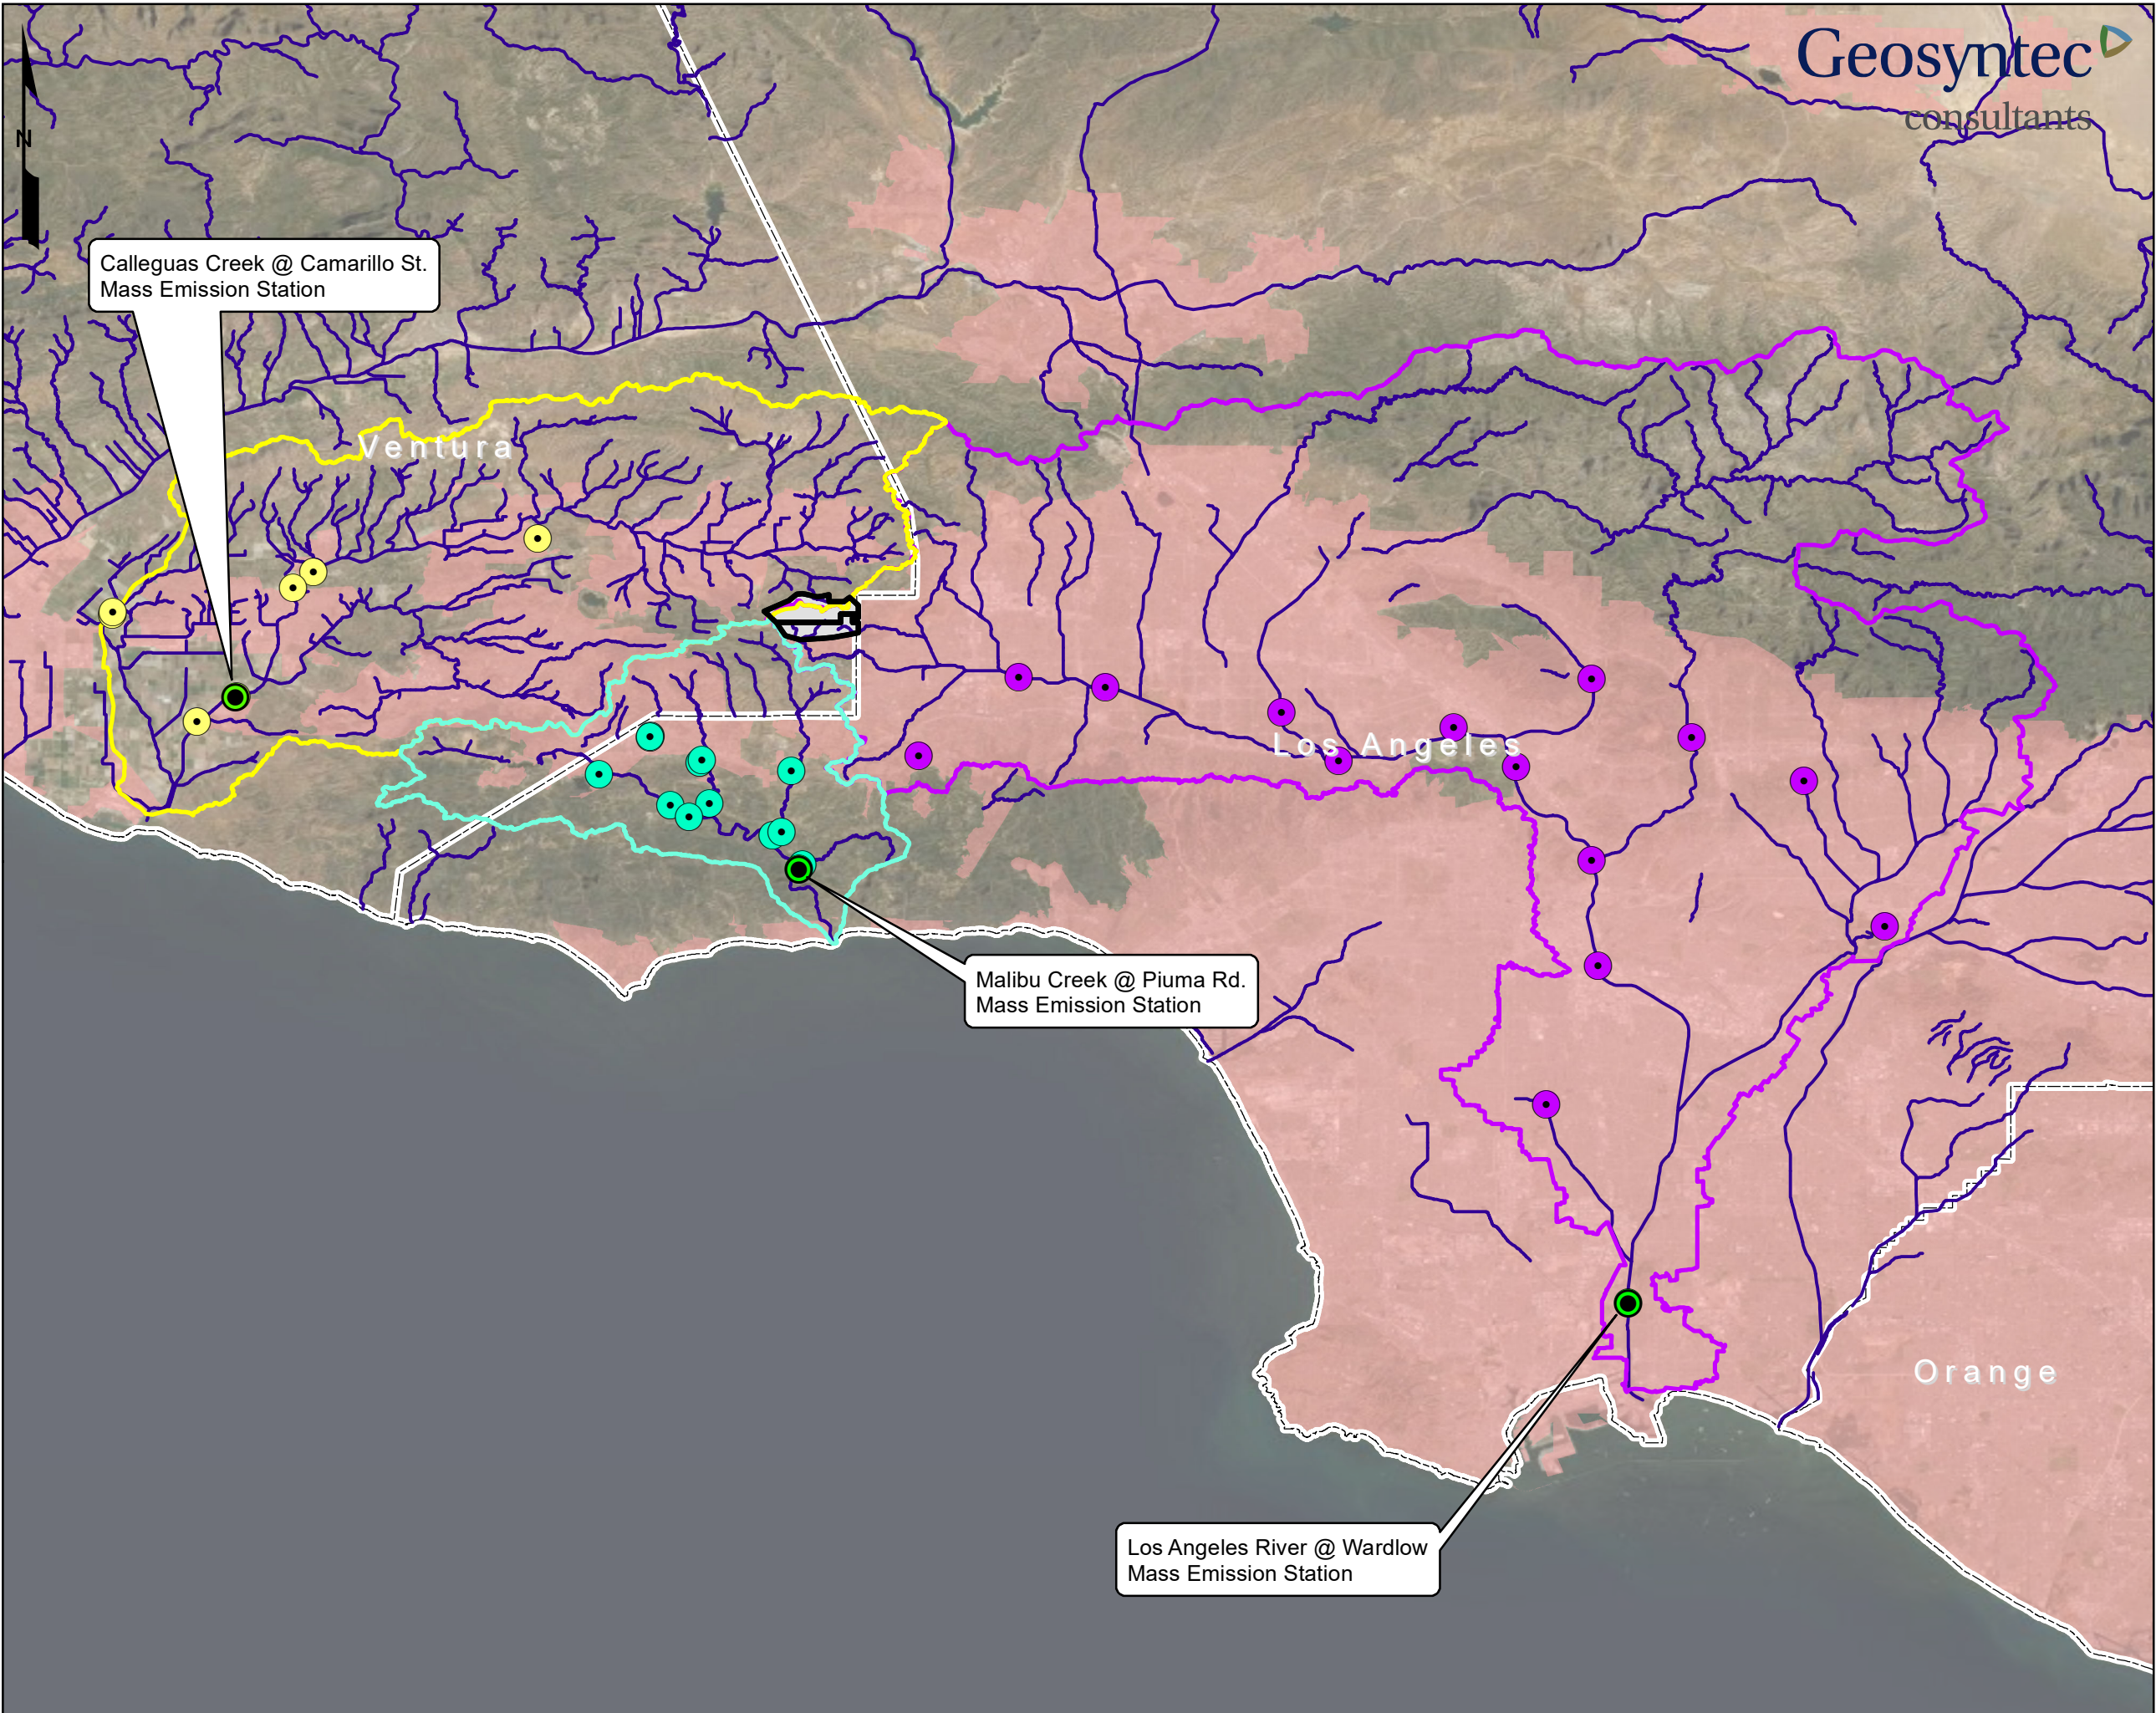

The concentration boxplots show non-detect results at the method detection limit (MDL) where available, or average MDL where no MDL was reported for the sample. A summary of the MDLs for SSFL samples and offsite receiving water samples is shown in Table 1. MDLs may vary for a constituent depending on the analytical method used and if any dilutions were necessary due to interferences in the sample.

Particulate strength (PS) is the constituent concentration associated with particulate matter in stormwater and is a means to normalize stormwater constituent concentrations by TSS. Normalizing constituent concentrations by TSS is helpful for comparing solid concentrations between sample locations. This tool is useful for the constituents that are highly associated with particulates and are not found in significant quantities in filtered (dissolved) forms. The particulate strength boxplots show the total minus dissolved concentration divided by the total suspended solids (TSS) concentration. These boxplots only show results where results for the concentration of the "total" fraction (e.g. total iron) were detected. For the few samples where the dissolved concentration was not detected in the sample, the MDL was used in the calculation. Where the dissolved concentration was greater than the total concentration, the average dissolved fraction for the watershed was used to estimate the dissolved concentration.

¹ Wet weather samples were differentiated from dry weather samples using historical precipitation data from several rain gauges unique to each watershed (NOAA CDO and MesoWest).

Total Suspended Solids	0	1.5	13	0.5	2.6	33

2. Results

The following plots in Figures 3-15 show stormwater concentrations at SSFL Outfalls and nearby surface waters grouped by major watershed: Calleguas Creek, Los Angeles River, and Malibu Creek. SSFL Outfall 018 is shown separately because these samples are unique as they reflect stormwater treated by the Silvernale active stormwater treatment system.

Based on visual comparison of the grouped data plotted below, SSFL stormwater discharges have lower concentrations, on average, than regional surface waters for copper, cyanide, lead, manganese, nickel, nitrate + nitrite as nitrogen, selenium, sulfate, TCDD TEQ (no DNQ) (based on statewide data), and zinc.

SSFL stormwater discharges also have lower particulate strengths, on average, than regional surface waters for arsenic, copper, cyanide, lead (except Outfall 009 which has an average about 1.5x the offsite average, but less than the 75th percentile of offsite concentrations), nickel (except for two unusually results at Outfall 009) and zinc.

SSFL discharges have slightly higher average concentrations for arsenic (though only relative to the Los Angeles River and Malibu Creek) and, potentially, gross alpha, though this dataset is very limited. For arsenic, the lower particulate strength in SSFL stormwater indicates these concentrations are likely TSS driven (i.e., there may be more soil in the SSFL samples than the creek/river samples, but this soil is lower in arsenic than elsewhere) and is consistent with the understanding of arsenic in stormwater being mostly from natural soils. For gross alpha, there is no particulate strength data for offsite locations, and the concentration data (6 samples, all from the Sacramento area in 2013) are too few to allow comparison. Similarly, there is no dioxin (TCDD TEQ (no DNQ)) particulate strength data for offsite locations, and the concentration data (from central and northern California area in 2009/10). More research should be done next year to identify comparable stormwater and/or wet weather creek and river data for these important parameters.

Iron particulate strengths in SSFL stormwater are slightly higher than nearby receiving waters. This may be due to differences in geology or sources of suspended solids (the other watersheds, particularly the Los Angeles River, have greater urban area, unlike SSFL, and lower percentages of undeveloped area that contributes iron-rich natural soils).

In summary, SSFL stormwater quality is comparable to or better than that of regional surface waters, with few exceptions as described above.

1. Questions and Responses from the August 11, 2020 Santa Susana Field Laboratory (SSFL) Stormwater Expert Panel Meeting

Some of the responses were provided during the meeting. We have added responses for the items we could not respond to at the meeting. There are some questions that require more effort to answer and we will answer them later. Slides from the public meeting are available online at:

<http://www.boeing.com/principles/environment/santa-susana/technical-reports.page>

Question 1:

I was not part of the community survey -- which is fascinating considering the number of years and quality of my comments for two decades.

The Expert Panel does not maintain any mailing list of its own. Boeing's community list was used for the distribution of the public survey prior to this meeting. Not being on this survey will not limit you from being able to submit questions for the Panel members to address, as you can see here.

Question 2:

What were the exceedances in? What toxic materials?

This year's exceedances are listed on slide 20; they are iron, lead, manganese, gross alpha, and dioxins, and are limited to Outfalls 001 and 002.

Question 3:

Are you seriously suggesting that the water doesn't flow past outfall 2 down Bell Canyon?? Why these inaccuracies?

We do not believe there are inaccuracies. Slide 15 depicts the outfalls that flow to Bell Creek; they are Outfalls 001, 002, 011, and 018. The Expert Panel released a memo on July 18, 2018 that analyzed flows from Outfall 002 with particular focus on the 2016/2017 rainy season. This memo discusses stormwater flows that occur at Outfall 002 (see below). In addition, there are a number of known seeps in this area, including ones downstream of the surface water Outfalls, which in addition to other offsite sources, may be contributing to flows observed in Bell Canyon downstream of Outfall 002 even when there is no flow at Outfall 002.

Question 4:

Is the ELV Treatment BMP actually turned on?

The ELV treatment BMP was operational this year.

Question 5:

Try looking where the water actually flows down Bell Canyon.

The Expert Panel's work is focused on treating surface water stormwater flows onsite before they leave the Site (which are regulated under the RWQCB NPDES permit)., In addition, the Expert Panel has conferred with the Groundwater Expert Panel to understand their studies and findings related to seeps offsite and downgradient of the site. The Groundwater Expert Panel has responsibility for analyzing and

reporting on these groundwater discharge features. The Expert Panel also visited the Bell Canyon area to see these perennially flowing drainages.

In 2018 the Expert Panel and Geosyntec analyzed the stormwater flow patterns of Outfall 002 during the 2016/2017 rainy season, which was the most available, complete yearly data at the time of the study. The report is dated 6 July 2018 and has been posted on the SSFL website (http://www.boeing.com/assets/pdf/aboutus/environment/santa_susana/water_quality/tech_reports/Final_Evaluation_of_Drainage_Patterns_at_Outfall_002_Memo_20180706.pdf). The 2016-2017 annual rainfall was 23.4 inches which means it was a wetter than average year. The report shows that Outfall 002 discharged four times during the 14 rainfall events and each was sampled at least once. There were two exceedances at Outfall 002 in the 2016/2017 season, one each for chronic toxicity and iron. There are additional conclusions in the report.

Question 6:

Why are you not monitoring where the water flows, DOWN HILL below 2 to Bell Creek? Water doesn't flow up to the BG01. This feels like intentional failure to look where the water flows....for 12 years, I feel like a broken record.

Flows in Bell Creek downstream of Outfall 002 include flows seeps and sources other than SSFL (see responses above). Surface water flows along with any contributions from onsite seeps are monitored at Outfall 002 and are under the regulatory responsibility of the Los Angeles Regional Water Quality Control Board. The Expert Panel advises Boeing and the Board on these flows. The Department of Toxic and Substance Control is responsible for any contaminant issues related to groundwater and any groundwater flow from the Site. Documents and status reports on the groundwater issues are regularly issued by the DTSC and the public is referred to the DTSC website for further information on this issue.

Question 7:

Sounds a lot like you are looking really hard for other reasons that exclude the obvious discharges for 70 years. Magic.

No surface water discharges that leave the property at major drainages are missed by the NPDES compliance sampling locations. We are not aware of any drainages that are not monitored by the NPDES permit.

Question 8:

Maybe that is why the creek is orange, Bell Creek, below outfall 2, where I have shown you many many times. But we will ignore that, and ignore me until I go away, and keep searching tirelessly for reasons to blame the roads for the 70 years of toxic operations. Deeply troubling indeed.

See prior responses. We agree that offsite perennial flows occur along Bell Creek. The orange color indicates iron-reducing bacteria deposits that are typical of exfiltrating groundwater.

Question 9:

I will say that I am deeply insulted about the way I have been treated and targeted and excluded despite my years of work. I was silenced and this panel helped them do so. Otherwise, I would have been

included in the survey after so many many many many years of work and substantive contribution. Shame on you.

We're sorry to hear this. We've always taken your comments and questions seriously, and investigated many of the fair issues you've raised, including discussion with Boeing and the Groundwater Expert Panel (GW EP), reviewing studies and monitoring reports on the seeps, and visiting the Bell Canyon drainages ourselves.

Question 10:

So the whole Q&A portion is for other people who received this in advance instead of allowing questions here at the end? I request that my questions be answered after sitting through this meeting, told questions would be answered.

No, just as you submitted questions to the Panel live now, others are doing the same.

Question 11:

How do contaminant concentrations in run-off compare to those in local streams -- LAR, Malibu Creek, etc.

Most of our stormwater concentrations are comparable or less concentrated to stormwater in natural reference watersheds, like those in the Santa Monica Mountains. Generally, SSFL's stormwater concentrations are better than urban stormwater quality like you'd find in the Lower LA River. To more completely answer your question, we will compare the SSFL stormwater quality to local streams in our annual report.

Question 12:

Some dioxin exceedances suggest turbidity breakthrough. Is that possible.

Generally, dioxins are associated with suspended solids. Also, many of the other contaminants are also associated with suspended solids. Turbidity is the result of suspended solids in the small particle range. So you are correct in your suggestion. Many or most of our BMPs are designed to remove suspended solids. In reviewing this past year's data, we noted that the ELV BMP may be experiencing media loss into the effluent, but not necessarily chemical breakthrough. We are evaluating this and will address as needed. We review all of the BMPs for maintenance needs and fix problems if they occur.

Question 13:

What material will be used for replacement stakes, if used?

At present we believe they would just be removed and not replaced.

Question 14:

How do the SSFL discharge limits compare to adjacent community drinking water standards?

SSFL stormwater discharge limits are generally equal to or more stringent than drinking water standards. The only drinking water standard exceedances in stormwater this year were for a single sample for gross alpha, but not for the annual average, and for iron and manganese. Iron and manganese are aesthetic (taste and appearance) based and are not human health based. All other regulated constituents (dozens of them) meet the most protective standards that are reflected in the NDPES permit. The measured gross

alpha value (14.1 +/- 3.6 pCi/L) did not exceed the permit, but the upper error bar did (17.1 pCi/L vs 15 pCi/L). The lower error bar was well below the permit (10.5 pCi/L vs 15 pCi/L). We believe gross alpha is associated with naturally occurring uranium in the soil and its decay products, and exceedances in the past have generally occurred when the suspended solids concentrations were very high. It is also important to note that exceeding stormwater concentrations are often short-term, whereas drinking water standards assume long-term, lifetime exposure (consumption).

Question 15:

Will the BMP's be required in perpetuity at the site?

We've tried to make all BMPs natural and passive where possible, but the structural treatment controls are not intended for use beyond site cleanup.

Question 16:

It was mentioned that 2.1% of water in LAR, as measured at Sepulveda Basin, originated from SSFL. Where was that measured in relation to Tillman?

The Tillman Water Reclamation Plant discharges downstream of the Sepulveda Basin.

Question 17:

Replacing all the burned power poles would be a terrible investment? How many people lost their homes to Woolsey fire that started at SSFL and I was threatened for saying so and no expertise in WATER. Look in the sky. The burned part too?

Many of the poles onsite don't belong to Boeing so they have no control over these. The power companies replaced their poles were burned in the fire. NASA has removed all unused poles. Boeing has removed most unused poles and is evaluating the feasibility of removing the rest.

Question 18:

Why/how were you previously only charged with addressing Outfalls 008 and 009, and when did this change to site-wide?

This charge originally came from the Regional Water Quality Control Board (RWQCB) in 2007 (presumably because more of the exceedances were occurring there), then it was updated to become site-wide in the 2015 NPDES permit.

Question 19:

Is the lead naturally occurring?

Our analysis suggests yes, but we have performed a special study using stable isotope analysis to help us understand source. We are waiting on additional lab results from UC Davis to confirm this. It has been delayed by work restrictions due to Covid-19.

Question 20:

Is the Silvernale Pond, where storm water is routed to, an unlined pond? Treatment was mentioned, how much do they treat this water, as it is my understanding that water here has the potential to seep into the groundwater.

The Ground Water Expert Panel has done water balance studies and found pond infiltration to be very minimal. The water level in the pond is kept as low as possible to provide storage for future storms. Lowering the level reduces infiltration. Pond water is treated prior to discharging to surface water drainages.

Question 21:

Have you looked at other studies on wildfire effects on stormwater quality?

Yes, we've reviewed several peer-reviewed studies and SSFL concentrations for many constituents, including dioxins and metals, are similar to stormwater concentrations found in natural burned watersheds.

Question 22:

If utility poles are dioxin sources then dioxin should be in stormwater everywhere? How do you expect us to believe this given SSFL's history with dioxin contamination?

Yes, dioxins are in stormwater everywhere, particularly in urban watersheds. Impacted soils are also another potential source that we considered. We look at dioxin congener fingerprints to determine sources of dioxins in SSFL stormwater. Professor Stenstrom's group at UCLA published the first journal paper identifying dioxins in urban stormwater. There is a "white paper" on the SSFL site which the Expert Panel and its consultants wrote comparing SSFL dioxin concentrations.

Question 23:

Are you aware of information showing background soil concentrations nearby offsite are lower than elsewhere?

We are aware of many sources of background soil data but perhaps not the ones you are referring. Please share your sources, and we'll look into it.

Question 24:

How can you dismiss the Radon in the exceedances at Outfall 001 as "Naturally Occurring" when this is the runoff from the AREA I Burn Pit on Boeing Property which Radium-226 and Radium 228 was discovered in 2009 - see link https://www.dtsc-ssfl.com/files/lib_rcra_soils/group_1b/rfireport/RFI-FILES/38138_Appendix_D_Area_I_Burn_Pit_1.pdf

Almost all of the Area 1 Burn Pits drain to Outfall 011 which did not discharge this year. A small portion of the Area 1 Burn Pits drains to Outfall 001 and runoff from this area is now sampled as part of the new southern buffer zone subarea monitoring. On December 27, 2019 a stormwater sample from Outfall 001 was collected and gross alpha was reported at 14.1+/-3.61 pCi/L. Additional analyses of the sample were conducted at an independent, State-certified laboratory for an additional 13 naturally occurring and 4 man-made alpha emitting radionuclides. This isotopic analysis found only naturally occurring radioactive material (NORM) was detected and no anthropogenic (man-made) alpha emitting radionuclides were detected.

Question 25:

Can the power poles be replaced?

Many of the poles onsite do not belong to Boeing so they have no control over these. BMPs are now in place to limit the migration of dioxins from these sources. NASA has removed all unused poles. Boeing has removed most unused poles and is evaluating the feasibility of removing the rest.

Question 26:

I was under the impression that exceedance indicate harm, so why would you view exceedances otherwise.

Exceedances are often short-term whereas the standards assume long-term, lifetime exposure. Also, a HHRA was also performed to assess this, and is publicly available.

2. Public Meeting Attendees

Surface Water Expert Panel members include Michael Stenstrom, Jonathan Jones, Michael Josselynn, Bob Gearheart, and Bob Pitt.

Below is the attendee list for the August 11, 2020 public meeting. These include a few RWQCB staff (Cris, Duong), Geosyntec staff (Brandon, Lauren, Maia, Tessa), Boeing staff (Jeff, Michael, Kamara, Paul), and a member of the Groundwater Expert Panel (Beth).

- Alec Uzemeck
- Amanda Pierce
- Beth Parker
- Bonnie Klea
- Brad Vanderhoof
